# **BeyondInsight and Password Safe API Overview**

This document specifies the Representational State Transfer (REST) compliant Application Programmer Interface (API) over HTTPS for BeyondInsight and Password Safe. It is a way to integrate a portion of the BeyondInsight and Password Safe functionality into your own applications.

Using the REST API makes it easier for users to build customized solutions for their specific needs while ensuring secure data transmission. The API provides a set of predefined operations, or endpoints, that can be accessed using HTTP Requests, including GET requests to retrieve data, POST requests to create new data, PUT requests to update existing data, and DELETE requests to remove data.

This resource is intended for readers with knowledge of HTTPS request and response processing, web development, and JSON notation.

For more information about enabling API Access, please see the following:

- BeyondInsight User Guide at https://www.beyondtrust.com/docs/beyondinsight-password-safe/bi/user/index.htm
- Password Safe Admin Guide at https://www.beyondtrust.com/docs/beyondinsight-password-safe/ps/admin/index.htm

# **Usage**

# **API Key**

The API key is a cryptographically strong random sequence of numbers hashed into a 128-character string. It is encrypted and stored internally using AES 256 encryption. Any language with a Representational State Transfer (REST) compliant interface can access the API with the API key and RunAs in the authorization header.

**Note:** Some environments may still use an old-style API key, which is a formatted Globally Unique Identifier (GUID). Rotating the API Key produces the new-style API key described above.

### **Session State**

Session state is maintained between API calls. The method is dependent on the scripting language. Initiate a session using API **POST Auth/SignAppIn** and always call **POST Auth/Signout** when you are done.

# **Base Endpoint**

The following base endpoint is used throughout this document. For on-premises instances, **the-server** is a placeholder and should be replaced with the server name in your environment.

<base> = https://the-server/BeyondTrust/api/public/v3

For cloud instances, the-cloud-instance-url is a placeholder and should be replaced with the cloud instance URL in your environment.

<base> = https://the-cloud-instance-url/BeyondTrust/api/public/v3

SSL is required to use the Password Safe Public API.

# **Authorization Header**

Use the web request authorization header to communicate the API application key, the RunAs username, and the user password:

- key: The API key configured in BeyondInsight for your application.
- runas: The username of a BeyondInsight user that has been granted permission to use the API key.
- pwd: The RunAs user password surrounded by square brackets (optional; required only if the User Password is required on the application API registration).

Authorization=PS-Auth key=c479a66f...c9484d; runas=doe-main\johndoe; pwd=[un1qu3];

**Note:** The API keys in the examples have been shortened for brevity. A domain user is being used. When using a domain user, depending on the programming or scripting tool used, you may need to escape the backslash (\) character between the domain name and username.

### **Two-Factor Authentication**

Depending on how the two-factor server is configured, a programmatic two-factor challenge is sometimes required.

### No Challenge

If the two-factor server is configured to authenticate through a push or mobile two-factor challenge, a challenge response is often not required. The first call to **POST Auth/SignAppIn** logs the user in, as long as the authentication request to the two-factor server does not time out.

# Challenge

When a two-factor challenge is configured, two calls to **POST Auth/SignAppIn** are required and session state must be maintained between these two calls to validate the two-factor challenge.

The initial call to POST Auth/SignAppIn results in a 401 Unauthorized response which contains a header WWW-Authenticate-2FA containing the prompt from the authentication service. The prompt can be used to prompt the user for the challenge answer.

**Note:** If the WWW-Authenticate-2FA header is not present, a two-factor authentication challenge has not been configured for the user.

When the challenge answer has been received from the user, **POST Auth/SignAppIn** is called again with the challenge answer in the authorization header, similar to the other authorization parameters:

• challenge: The answer to the two-factor challenge.

Authorization=PS-Auth key=c479a66f...c9484d; runas=doe-main\johndoe; pwd=[un1qu3]; challenge=543687;

Note: The challenge answer is only required on the second call to POST Auth/SignAppIn and not on subsequent requests.

# **OAuth Public API Authentication**

The OAuth sign-in method uses the OAuth client credential flow. The client credentials grant type is used by clients to obtain an access token outside of the context of a user.

Only users with user type **Application**, who are associated to an **API Access Policy** API registration in BeyondInsight, can use this authentication method.

**Note:** Impersonation for the OAuth client credential flow is different than API key. Instead of providing the **RunAs** user as part of the Authorization header you provide the RunAs user using a new **RunAs** header. You can only impersonate users who are in the same group as the application user.

**Note:** Setting up an OAuth authentication method requires the following steps:

- · Create an API Registration using the API Access Policy type
- · Create an application user
- Assign your access policy to the user
- · Record their client ID and secret for later use
- · Assign user to a group with necessary permissions

For more information, please see OAuth 2.0 Client Credentials Grant at https://oauth.net/2/grant-types/client-credentials.

# **Common Response Codes**

Below are response codes common to all APIs. Custom responses are detailed in the individual endpoints.

- 200 Request successful.
- 204 Request successful. No content in body.
- 400 Bad Request Validation failure, missing request body, or string values exceed the maximum length. Reason in response body.
- 401 Unauthorized User is not authenticated. Typical reasons include:
  - o An invalid product license was detected.
  - The request headers were not set properly.
  - The server could not verify the validity of the request (due to one or more API factors).
  - The user session has expired.
  - The API key has been rotated but has not been updated in the calling script or application.

**Tip:** When you encounter a 401 error due to factor validation failure, a User Audit entry is created in BeyondInsight and an email is sent to the administrator detailing the reason. Look here first for the reason why authorization failed.

• 403: - Access forbidden. User does not have the appropriate role or permission.

Tip: A 403 can also occur when SSL trust cannot be established.

- 404 Object not found where expected. Reason in response body.
- 500 Unexpected server error occurred. Please contact the developers.

# **Examples**

Example: C#

Create and reuse a persistent connection using the System. Net. Http. Http Client class.

```
HttpClient client = new HttpClient();
client.DefaultRequestHeaders.Add("Authorization",
   "PS-Auth key= c479a66f...c9484d; runas=doe-main\\johndoe;");

string json = Newtonsoft.Json.JsonConvert.SerializeObject(null);
System.Net.Http.StringContent content = new StringContent(json);
content.Headers.ContentType = new System.Net.Http.Headers.MediaTypeHeaderValue
("application/json");

HttpResponseMessage signInResponse = client.PostAsync("<base>/Auth/SignAppin",
content).Result;
```

#### Subsequent calls:

```
HttpResponseMessage getResponse = client.GetAsync("<base>/ManagedAccounts").Result;
```

#### User Password Factor Enabled (header example only)

```
HttpClient client = new HttpClient();
client.DefaultRequestHeaders.Add("Authorization",
"PS-Auth key= c479a66f...c9484d; runas=doe-main\\johndoe; pwd=[un1qu3];");
```

#### Example: Powershell

Powershell internally creates a session variable to use for each subsequent call; Invoke-RestMethod CmdLet options - SessionVariable and -WebSession respectively. In the below example, the variable is named "session" and has script-level scope.

```
$headers = @{ Authorization="PS-Auth key=c479a66f...c9484d; runas=doe-main\\johndoe;"; };
$uri = "<base>/Auth/SignAppin";
$signinResult = Invoke-RestMethod -Uri $uri -Method POST -Headers $headers -
SessionVariable script:session;
```

#### Subsequent calls:

```
$uri = "<base>/ManagedAccounts";
$accounts = Invoke-RestMethod -Uri $uri -Method GET -WebSession $script:session -Headers
$headers;
```

#### Example: Java

Create and reuse a persistent connection using the java.net.HttpURLConnection class.

**API GUIDE** 

URL baseURL = new URL("HTTPS", "the-server", 443, "/BeyondTrust/api/public/v3/");
URL url = new URL(baseURL, "Auth/SignAppIn");
HttpURLConnection conn = (HttpURLConnection)url.openConnection();
conn.setRequestProperty("Authorization", "PS-Auth key=c479a66f...c9484d; runas=doe-main\\johndoe;");

#### Example: Ruby

Using the rest-client gem, carry over the ASP.NET\_SessionId header.

```
samp_key = 'PS-Auth key= c479a66f...c9484d; runas=doe-main\\johndoe;'
result = RestClient::Request.execute(method: :post, url: '<base>/Auth/SignAppin',
:headers => { 'Authorization' => samp_key} )
session_id = result.cookies["ASP.NET_SessionId"]
```

#### Subsequent calls:

```
result = RestClient::Request.execute(method: :get, url: '<base>/ManagedAccounts',
:headers=>{ 'Authorization' => samp_key, :cookies => { 'ASP.NET_SessionId' => session_id}})
```

#### Example: Python

Create and reuse a persistent connection using the requests module.

```
header = {'Authorization': 'PS-Auth key=c479a66f...c9484d; runas=doe-main\\johndoe;'}
session = requests.Session()
session.headers.update(header)
response = session.post('<base>/Auth/SignAppin')
```

#### Subsequent calls:

```
accounts = session.get('<base>/ManagedAccounts')
```

#### Example: Bash

Using curl, option **–c** will create cookie file and **–b** will use it in subsequent API calls.

```
curl -i -c pbpscookie.txt -X POST https:<base>/Auth/SignAppin -H "Content-Type: application/json" -H "Authorization: PS-Auth key=c479a66f...c9484d; runas=doe-main\\johndoe;" -d ""
```

#### Subsequent calls:

curl -i -b pbpscookie.txt -X GET https:<base>/ManagedAccounts -H "Content-Type:
application/json" -H "Authorization: PS-Auth key=c479a66f...c9484d; runas=doemain\\johndoe;" -d ""

#### Workflow

There are some loose dependencies between the APIs. A typical sequence is to list accounts or find an account, request a password, retrieve that password (once approved), and then release the password.

#### Create and Manage an Asset, Create User Group, Assign Roles

Case: Create and manage an asset, create a managed account, create a managed account quick rule, create/provision an LDAP/AD/BeyondInsight user group, grant **Read** access to new Smart Rule with requester role and access policy.

- · POST <base>/Auth/SignAppin
- POST <base>/Workgroups/{ID}/Assets
- POST <base>/Assets/{assetId}/ManagedSystems
- POST <base>/ManagedSystems/{managedSystemId}/ManagedAccounts
- POST <base>/QuickRules
- POST <base>/UserGroups
- POST <base>/UserGroups/{userGroupId}/SmartRules/{smartRuleId}/Roles
- · POST <base>/Auth/Signout

#### Retrieve a Password

Case: request, retrieve, and check in a password for a managed account:

- POST <base>/Auth/SignAppin
- GET <base>/ManagedAccounts OR GET <base>/ManagedAccounts?systemName={systemName}&accountName= {accountName}
- POST <base>/Requests
- GET <base>/Credentials/{requestId}
- PUT <base>/Requests/{requestId}/Checkin
- · POST <base>/Auth/Signout

#### Create a Session

Case: request a session, create a session, and check in the request for a managed account:

- POST <base>/Auth/SignAppin
- GET <base>/ManagedAccounts OR GET <base>/ManagedAccounts?systemName={systemName}&accountName= {accountName}
- POST <base>/Requests (AccessType="RDP" or AccessType="SSH" or AccessType="App")

- POST <base>/Requests/{requestId}/Sessions (SessionType == Request.AccessType above)
- PUT <base>/Requests/{requestId}/Checkin
- POST <base>/Auth/Signout

#### Retrieve a Password as an ISA

Case: create an ISA password request:

- POST <base>/Auth/SignAppin
- GET <base>/ManagedAccounts OR GET <base>/ManagedAccounts?systemName={systemName}&accountName= {accountName}
- POST <base>/ISARequests
- POST <base>/Auth/Signout

#### Create a Session as an ISA

Case: create an ISA session:

- POST <base>/Auth/SignAppin
- GET <base>/ManagedAccounts OR GET <base>/ManagedAccounts?systemName={systemName}&accountName= {accountName}
- POST <base>/ISASessions
- POST <base>/Auth/Signout

# **Authentication**

### **Quick Navigation**

- "POST Auth/SignAppin" on page 21
- "POST Auth/Signout" on page 22
- "POST Auth/Connect/Token" on page 23 (OAuth)
- "POST Auth/SignAppIn" on page 24 (OAuth)

# POST Auth/SignAppin

### **Purpose**

Authenticates the provided credentials and creates a user session.

# **Required Permissions**

A user group to which the user belongs must be granted access to the API key given in authorization header. Must be running script from a valid source address as configured in API registration for the given API key.

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

```
UserId: int,
SID: string,
EmailAddress: string,
UserName: string,
Name: string
}
```

# **Response Codes**

- 200 Request successful. User model in the response body.
- 403 Access forbidden. Returned if the Password Safe license is not valid.
- 410 API version has been disabled.

For more information, please see "Common Response Codes" on page 16.

# **POST Auth/Signout**

# **Purpose**

Terminates the current user session.

# **Required Permissions**

None.

# **Request Body**

None.

# **Response Body**

None.

# **Response Codes**

• 200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **OAuth Public API Authentication**

### POST Auth/Connect/Token

### **Purpose**

Authenticates the provided credentials and allows access to the public API.

### **Required Permissions**

Application user must be associated to an API Access Policy API registration and must belong to a user group with necessary permissions.

### **Request Body**

Content-Type: application/x-www-form-urlencoded

```
grant_type=client_credentials&client_id=[user-client-id]&client_secret=[user-client-secret]
```

# **Response Body**

Content-Type: application/x-www-form-urlencoded

```
{
    access_token: string,
    expires_in: int,
    token_type:string = "Bearer",
    scope: string
}
```

# **Response Body Details**

- access\_token: The privileged credential to use in the Authorization header for API requests to authenticate the use.
- · expires\_in: Lifetime (in seconds) that the token is valid.
- token type: Describes the access token (always Bearer).
- **scope**: Describes the scope of the access token, which is what the token is allowed to perform. For application users, this consists of only a scope called **publicapi**.

# POST Auth/SignAppIn

# **Request Body**

None.

#### Header

Authorization: Bearer [access\_token]

Note: Cookies are still supported using this sign-in method.

# **BeyondInsight APIs**

The BeyondInsight APIs require a valid BeyondInsight license and are available to Password Safe-licensed installs.

# **Access Levels**

(i.e., None, Read, Read/Write)

# **Quick Navigation**

- "GET AccessLevels" on page 26
- "POST UserGroups/{userGroupId}/SmartRules/{smartRuleId}/AccessLevels" on page 27

### **GET AccessLevels**

# **Purpose**

Returns a list of access levels for permissions, for example, None, Read, and Read/Write.

# **Required Permissions**

User Accounts Management (Read).

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

# **Response Codes**

200 - Request successful. Access Levels in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST UserGroups/{userGroupId}/SmartRules/ {smartRuleId}/AccessLevels

# **Purpose**

Sets the Access Level for a User Group Smart Rule.

# **Required Permissions**

· User Accounts Management (Read/Write).

### **URL Parameters**

- · userGroupId: ID of the user group.
- smartRuleId: ID of the Smart Rule.

# **Request Body**

Content-Type: application/json

```
{
    AccessLevelID: int
}
```

# **Response Body**

None.

# **Response Codes**

· 200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **Address Groups**

# **Quick Navigation**

- "GET Organizations/{orgID}/addressgroups" on page 28
- "GET Addresses/{id}" on page 38
- "GET Addressgroups" on page 29
- "GET AddressGroups/{id}" on page 34
- "GET Addressgroups/{addressGroupId}/addresses" on page 30
- "GET AddressGroups/?name={name}" on page 33
- "POST AddressGroups/{id}/Addresses" on page 31
- "POST AddressGroups" on page 37
- "DELETE Addresses/{id}" on page 39
- "DELETE Addressgroups/{addressGroupId}" on page 32
- <u>"DELETE Addressgroups/{addressGroupId}/addresses" on page 33</u>
- "PUT Addresses/{id}" on page 35
- "PUT AddressGroups/{id}" on page 36

# **GET Organizations/{orgID}/addressgroups**

# **Purpose**

List the address groups for a given organization.

# **Required Permissions**

- Current user has access to the organization.
- · Asset Management (Read).

### **URL Parameters**

orgld: Organization ID.

# **Request Body**

None.

# **Response Body**

```
[
          AddressGroupID: int,
          Name: string,
          OrganizationID: guid // can be null
     }
]
```

### **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **GET Addressgroups**

### **Purpose**

List the address groups.

# **Required Permissions**

- Current user has access to the organization.
- · Asset Management (Read).

#### **URL Parameters**

None.

# **Request Body**

None.

# **Response Body**

```
[
AddressGroupID: int,
Name: string,
OrganizationID: guid // can be null
```

{ ]

# **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **GET Addressgroups/{addressGroupId}/addresses**

# **Purpose**

List the addresses for an address group.

# **Required Permissions**

- Current user has access to the organization.
- · Asset Management (Read).

#### **URL Parameters**

addressGroupId: Address Group ID.

# **Request Body**

None.

# **Response Body**

```
[
    AddressID: int,
    AddressGroupID: int,
    Omit: boolean,
    Type: string,
    Value: string,
    LastUpdatedDate: datetime
}
```

# **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# POST AddressGroups/{id}/Addresses

### **Purpose**

Create an address in an Address Book.

### **Required Permissions**

• Asset Management (Read/Write).

#### **URL Parameters**

addressGroupId: Address Group ID.

# **Request Body**

```
{
   Type: int,
   Value: string,
   Omit: bool
}
```

# **Request Body Details**

Max string length for Value is 225.

# **Response Body**

```
AddressID: int,
AddressGroupID: int,
Omit: bool,
Type: int,
Value: string,
```

LastUpdatedDate: datetime

# **Response Codes**

201 - Request successful. Address in the response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE Addressgroups/{addressGroupId}**

### **Purpose**

Delete the address group and all it's addresses.

# **Required Permissions**

- · Current user has access to the organization.
- · Asset Management (Read/Write).

#### **URL Parameters**

addressGroupId: Address Group ID.

# **Request Body**

None.

# **Response Body**

None.

# **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# DELETE Addressgroups/{addressGroupId}/addresses

### **Purpose**

Delete the addresses within the address group.

# **Required Permissions**

- · Current user has access to the organization.
- · Asset Management (Read/Write).

#### **URL Parameters**

addressGroupId: Address Group ID.

# **Request Body**

None.

### **Response Body**

None.

# **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **GET AddressGroups/?name={name}**

# **Purpose**

Returns the Address Group by name.

# **Required Permissions**

· Asset Management (Read).

# **Query Parameters**

name: Name of the Address Group.

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

```
{
    AddressGroupID: int,
    Name: string
}
```

### **Response Codes**

200 - Request successful. Address Group in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET AddressGroups/{id}**

# **Purpose**

Returns the Address Group by ID.

# **Required Permissions**

· Asset Management (Read).

#### **URL Parameters**

id: ID of the Address Group.

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

```
{
   AddressGroupID: int,
   Name: string
}
```

### **Response Codes**

200 - Request successful. Address Group in the response body.

For more information, please see "Common Response Codes" on page 16.

# **PUT Addresses/{id}**

### **Purpose**

Updates and Address by ID.

# **Required Permissions**

· Asset Management (Read/Write).

# **Request Body**

Content-Type: application/json

```
Type: int,
Value: string,
Omit: bool
}
```

# **Request Body Details**

Max string length for Value is 225.

# **Response Body**

```
AddressD: int,
AddressGroupID: int,
Omit: bool,
Type: int,
Value: string,
LastUpdateDate: datetime
}
```

# **Response Codes**

200 - Request successful. Address in the response body.

For more information, please see "Common Response Codes" on page 16.

# PUT AddressGroups/{id}

# **Purpose**

Updates and Address Group by ID.

# **Required Permissions**

· Asset Management (Read/Write).

# **Request Body**

Content-Type: application/json

```
{
   Name: string,
}
```

# **Request Body Details**

Max string length for Name is 225.

# **Response Body**

```
{
AddressGroupID: int,
```

```
Name: string
}
```

### **Response Codes**

200 - Request successful. Address Group in the response body.

For more information, please see "Common Response Codes" on page 16.

# **POST AddressGroups**

### **Purpose**

Creates an Address Book.

# **Required Permissions**

Asset Management (Read/Write).

# **Request Body**

Content-Type: application/json

```
{
   Name: string
}
```

# **Request Body Details**

Max string length for Name is 225.

# **Response Body**

```
{
    AddressGroupID: int,
    Name: string
}
```

# **Response Codes**

201 - Request successful. Address Group in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Addresses/{id}**

### **Purpose**

Returns the Address by ID.

# **Required Permissions**

· Asset Management (Read).

#### **URL Parameters**

id: ID of the Address.

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

```
AddressId: int,
AddressGroupId : int,
Omit: bool,
Type: string,
Value: string,
LastUpdateDate: datetime
}
```

# **Response Codes**

200 - Request successful. Address in the response body.

# **DELETE Addresses/{id}**

### **Purpose**

Deletes an Address by ID.

### **Required Permissions**

Asset Management (Read/Write).

### **Request Body**

None.

# **Response Body**

None.

### **Response Codes**

200 - Request successful.

# **API Registrations**

### **Quick Navigation**

### **Response Codes**

201 - Request successful. API key in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET ApiRegistrations/{id}/Key**

Note: For API Key Policy only.

### **Purpose**

Retrieves the API key for an API Key policy API Registration.

# **Required Permissions**

API Registration Management (Read/Write).

# **Query Parameters**

...

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

string

# **Response Codes**

200 - Request successful. API Key in the response body.

# **GET Assets/{id}**

### **Purpose**

Returns an asset by ID.

# **Required Permissions**

Asset Management (Read).

#### **URL Parameters**

id: ID of the asset.

### **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
WorkgroupID: int,
AssetID: int,
AssetName: string,
DnsName: string,
DomainName: string,
IPAddress: string,
MacAddress: string,
AssetType: string,
OperatingSystem: string,
CreateDate: datetime,
LastUpdateDate: datetime
}
```

# **Response Codes**

200 - Request successful. Asset in response body.

# **GET Workgroups/{workgroupID}/Assets**

### **Purpose**

Returns a list of assets by Workgroup ID.

### **Required Permissions**

Asset Management (Read).

#### **URL Parameters**

workgroupID: ID of the Workgroup.

### **Query Parameters (Optional)**

- limit: (default: 100000) Number of records to return.
- offset: (default: 0) Number of records to skip before returning < limit> records (can be used in conjunction only with limit).

# **Request Body**

None.

# Response Body (when limit is not given)

```
{
    WorkgroupID: int,
    AssetID: int,
    AssetName: string,
    DnsName: string,
    DomainName: string,
    IPAddress: string,
    MacAddress: string,
    AssetType: string,
    OperatingSystem: string,
    CreateDate: datetime,
    LastUpdateDate: datetime
},
...
```

# Response Body (when limit is given)

Content-Type: application/json

# **Response Codes**

200 - Request successful. Assets in response body.

# **GET Workgroups/{workgroupName}/Assets**

### **Purpose**

Returns a list of assets by Workgroup name.

### **Required Permissions**

Asset Management (Read).

#### **URL Parameters**

workgroupName: Name of the Workgroup.

### **Query Parameters (Optional)**

- limit: (default: 100000) Number of records to return.
- offset: (default: 0) Number of records to skip before returning imit> records (can only be used in conjunction with limit).

# **Request Body**

None.

# Response Body (when limit is not given)

```
{
    WorkgroupID: int,
    AssetID: int,
    AssetName: string,
    DnsName: string,
    DomainName: string,
    IPAddress: string,
    MacAddress: string,
    AssetType: string,
    OperatingSystem: string,
    CreateDate: datetime,
    LastUpdateDate: datetime
},
...
]
```

## Response Body (when limit is given)

Content-Type: application/json

# **Response Codes**

200 - Request successful. Assets in response body.

# **GET Workgroups/{workgroupName}/Assets?name={name}**

### **Purpose**

Returns an asset by Workgroup name and asset name.

### **Required Permissions**

Asset Management (Read).

#### **URL Parameters**

workgroupName: Name of the Workgroup.

### **Query Parameters**

name: Name of the asset.

### **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
WorkgroupID: int,
AssetID: int,
AssetName: string,
DnsName: string,
DomainName: string,
IPAddress: string,
MacAddress: string,
AssetType: string,
OperatingSystem: string,
CreateDate: datetime,
LastUpdateDate: datetime
}
```

# **Response Codes**

200 - Request successful. Asset in response body.

# POST Workgroups/{workgroupID}/Assets

### **Purpose**

Creates a new asset in the Workgroup, referenced by ID.

### **Required Permissions**

Asset Management (Read/Write).

#### **URL Parameters**

workgroupID: ID of the Workgroup.

### **Request Body**

Content-Type: application/json

```
{
   IPAddress: string,
   AssetName: string,
   DnsName: string,
   DomainName: string,
   MacAddress: string,
   AssetType: string,
   OperatingSystem: string
}
```

# **Request Body Details**

- IPAddress: (required) Asset IP address. Max string length is 45.
- AssetName: (optional) Asset name. If not given, a padded IP address is used. Max string length is 128.
- DnsName: (optional) Asset DNS name. Max string length is 255.
- DomainName: (optional) Asset domain name. Max string length is 64.
- MacAddress: (optional) Asset MAC address. Max string length is 128.
- AssetType: (optional) Asset type. Max string length is 64.
- OperatingSystem: (optional) Asset operating system. Max string length is 255.

### **Response Body**

```
WorkgroupID: int,
AssetID: int,
AssetName: string,
DnsName: string,
DomainName: string,
IPAddress: string,
MacAddress: string,
AssetType: string,
OperatingSystem: string,
CreateDate: datetime,
LastUpdateDate: datetime
}
```

# **Response Codes**

201 - Request successful. Asset in response body.

# POST Workgroups/{workgroupName}/Assets

### **Purpose**

Creates a new asset in the Workgroup referenced by name.

### **Required Permissions**

Asset Management (Read/Write).

#### **URL Parameters**

workgroupName: Name of the Workgroup.

### **Request Body**

Content-Type: application/json

```
{
   IPAddress: string,
   AssetName: string,
   DnsName: string,
   DomainName: string,
   MacAddress: string,
   AssetType: string,
   OperatingSystem: string
}
```

# **Request Body Details**

- IPAddress: (required) Asset IP address. Max string length is 45.
- AssetName: (optional) Asset name. If not given, a padded IP address is used. Max string length is 128.
- DnsName: (optional) Asset DNS name. Max string length is 255.
- DomainName: (optional) Asset domain name. Max string length is 64.
- MacAddress: (optional) Asset MAC address. Max string length is 128.
- AssetType: (optional) Asset type. Max string length is 64.
- OperatingSystem: (optional) Asset operating system. Max string length is 255.

### **Response Body**

```
WorkgroupID: int,
AssetID: int,
AssetName: string,
DnsName: string,
DomainName: string,
IPAddress: string,
MacAddress: string,
AssetType: string,
OperatingSystem: string,
CreateDate: datetime,
LastUpdateDate: datetime
}
```

# **Response Codes**

201 - Request successful. Asset in response body.

# PUT Assets/{id}

### **Purpose**

Updates an existing asset by ID.

Tip: Call GET Assets/{id} (or equivalent) first to get the current state of the asset before calling PUT Assets/{id} to update it with new values.

# **Required Permissions**

Asset Management (Read/Write).

#### **URL Parameters**

id: ID of the asset.

### **Request Body**

Content-Type: application/json

```
WorkgroupID: int,
AssetName: string,
DnsName: string,
DomainName: string,
IPAddress: string,
MacAddress: string,
AssetType: string,
OperatingSystem: string,
}
```

# **Request Body Details**

- WorkgroupID: (required) ID of the Workgroup to which the asset belongs.
- · AssetName: (required) Asset name.
- DnsName: (required) Asset DNS name.
- DomainName: (required) Asset domain name.
- IPAddress: (required) Asset IP address.
- MacAddress: (required) Asset MAC address. An empty value is accepted and clears any existing value.
- AssetType: (required) Asset type. An empty value is accepted and clears any existing value.
- OperatingSystem: (required) Asset operating system. An empty value is accepted and clears any existing value.

## **Response Body**

Content-Type: application/json

```
WorkgroupID: int,
AssetID: int,
AssetName: string,
DnsName: string,
DomainName: string,
IPAddress: string,
MacAddress: string,
AssetType: string,
OperatingSystem: string,
CreateDate: datetime,
LastUpdateDate: datetime
}
```

### **Response Codes**

200 - Request successful. Asset in response body.

### **POST Assets/Search**

### **Purpose**

Returns a list of assets that match the given search criteria.

### **Required Permissions**

Asset Management (Read).

## **Query Parameters (Optional)**

- limit: (default: 100000) Number of records to return.
- offset: (default: 0) Number of records to skip before returning < limit> records (can only be used in conjunction with limit).

### **Request Body**

Content-Type: application/json

```
AssetName: string,
DnsName: string,
DomainName: string,
IPAddress: string,
MacAddress: string,
AssetType: string,
}
```

# **Request Body Details**

At least one request body property should be provided; any property not provided is ignored. All search criteria is case insensitive and is an exact match (equality), except for **IPAddress**.

**IPAddress** can be a single IP address (10.0.0.1), a comma-delimited list of IPs (10.0.0.1,10.0.0.2,10.0.0.3), an IP range (10.0.0.1-10.0.0.25), or CIDR notation (10.0.0.0/24).

# Response Body (when limit is not given)

```
[
     WorkgroupID: int,
     AssetID: int,
     AssetName: string,
```

```
DnsName: string,
  DomainName: string,
  IPAddress: string,
  MacAddress: string,
  AssetType: string,
  OperatingSystem: string,
  CreateDate: datetime,
  LastUpdateDate: datetime
},
...
```

## Response Body (when limit is given)

Content-Type: application/json

# **Response Codes**

200 - Request successful. Assets in response body.

# **DELETE Assets/{id}**

### **Purpose**

Deletes an asset by ID.

# **Required Permissions**

Asset Management (Read/Write).

#### **URL Parameters**

id: ID of the asset.

# **Request Body**

None.

### **Response Body**

None.

## **Response Codes**

200 - Request successful.

# **DELETE Workgroups/{workgroupName}/Assets?name={name}**

### **Purpose**

Deletes an asset by Workgroup name and asset name.

### **Required Permissions**

Asset Management (Read/Write).

#### **URL Parameters**

workgroupName: Name of the Workgroup.

### **Query Parameters**

name: Name of the asset.

### **Request Body**

None.

# **Response Body**

None.

# **Response Codes**

200 - Request successful.

### **Smart Rule Assets**

# **GET SmartRules/{id}/Assets**

### **Purpose**

Returns a list of assets by Smart Rule ID.

### **Required Permissions**

Read access to the Smart Rule referenced by ID.

#### **URL Parameters**

id: ID of the Smart Rule.

### **Query Parameters (Optional)**

- limit: (default: 100000) Number of records to return.
- offset: (default: 0) Number of records to skip before returning < limit > records (can be used only in conjunction with limit).

# **Request Body**

None.

# Response Body (when limit is not given)

```
WorkgroupID: int,
   AssetID: int,
   AssetName: string,
   DnsName: string,
   DomainName: string,
   IPAddress: string,
   MacAddress: string,
   AssetType: string,
   OperatingSystem: string,
   CreateDate: datetime,
   LastUpdateDate: datetime
},
...
]
```

## Response Body (when limit is given)

Content-Type: application/json

# **Response Codes**

200 - Request successful. Assets in response body.

### **Asset Attributes**

### **Quick Navigation**

- "GET Assets/{assetID}/Attributes" on page 72
- "POST Assets/{assetID}/Attributes/{attributeID}" on page 73
- "DELETE Assets/{assetID}/Attributes" on page 74
- "DELETE Assets/{assetID}/Attributes/{attributeID}" on page 74

# **GET Assets/{assetID}/Attributes**

### **Purpose**

Returns a list of attributes by Asset ID.

### **Required Permissions**

Asset Management (Read), Attribute Management (Read).

#### **URL Parameters**

assetID: ID of the asset.

# **Request Body**

None.

### **Response Body**

```
[
    AttributeID : int, AttributeTypeID : int,
    ParentAttributeID : int, // can be null
    ShortName : string,
    LongName : string,
    Description : string,
    ValueInt : int, // can be null
    IsReadOnly: bool
},
...
]
```

200 - Request successful. Attributes associated with the asset in the response body.

For more information, please see "Common Response Codes" on page 16.

## POST Assets/{assetID}/Attributes/{attributeID}

### **Purpose**

Assigns an attribute to an asset.

### **Required Permissions**

Asset Management (Read/Write), Attribute Management (Read/Write).

#### **URL Parameters**

- · assetID: ID of the asset.
- attributeID: ID of the attribute Request Body.

# **Response Body**

Content-Type: application/json

```
AttributeID : int, AttributeTypeID : int,
ParentAttributeID : int, // can be null
ShortName : string,
LongName : string,
Description : string,
ValueInt : int, // can be null
IsReadOnly: bool,
}
```

## **Response Codes**

201 – Request successful. Attributes in the response body.

# **DELETE Assets/{assetID}/Attributes**

### **Purpose**

Deletes all asset attributes by asset ID.

### **Required Permissions**

Asset Management (Read/Write), Attribute Management (Read/Write).

#### **URL Parameters**

assetID: ID of the asset.

## **Request Body**

None.

### **Response Body**

None.

## **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **DELETE Assets/{assetID}/Attributes/{attributeID}**

## **Purpose**

Deletes an asset attribute by asset ID and attribute ID.

## **Required Permissions**

- · Asset Management (Read/Write).
- Attribute Management (Read/Write).

#### **URL Parameters**

assetID: ID of the asset attributeID and ID of the attribute.

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

# **Attribute Types**

### **Quick Navigation**

- "GET AttributeTypes" on page 76
- "GET AttributeTypes/{id}" on page 77
- "POST AttributeTypes" on page 77
- "DELETE AttributeTypes/{id}" on page 78

## **GET AttributeTypes**

### **Purpose**

Returns a list of attribute types.

### **Required Permissions**

Attribute Management (Read).

## **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
[
    AttributeTypeID : int,
    Name : string,
    IsReadOnly: bool
},
...
]
```

## **Response Codes**

200 - Request successful. Attribute types in the response body.

# **GET AttributeTypes/{id}**

### **Purpose**

Returns an attribute type by ID.

## **Required Permissions**

Attribute Management (Read).

#### **URL Parameters**

id: ID of the attribute type.

## **Request Body**

None.

### **Response Body**

Content-type: application/json

```
{
   AttributeTypeID : int,
   Name : string,
   IsReadOnly: bool
}
```

## **Response Codes**

200 – Request successful. Attribute type in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST AttributeTypes

## **Purpose**

Creates a new attribute type.

### **Required Permissions**

Attribute Management (Read/Write).

## **Request Body**

Content-Type: application/json

```
{
   Name : string
}
```

## **Request Body Details**

Max string length for Name is 64.

### **Response Body**

Content-type: application/json

```
{
   AttributeTypeID : int,
   Name : string,
   IsReadOnly: bool
}
```

## **Response Codes**

201 – Request successful. Attribute type in the response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE AttributeTypes/{id}**

## **Purpose**

Deletes an attribute type and all related attributes by ID.

## **Required Permissions**

Attribute Management (Read/Write).

#### **URL Parameters**

id: ID of the attribute type.

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

### **Attributes**

## **Quick Navigation**

- "GET AttributeTypes/{attributeTypeID}/Attributes" on page 80
- "GET Attributes/{id}" on page 81
- "POST AttributeTypes/{attributeTypeID}/Attributes" on page 82
- "DELETE Attributes/{id}" on page 84

## **GET AttributeTypes/{attributeTypeID}/Attributes**

### **Purpose**

Returns a list of attribute definitions by attribute type.

### **Required Permissions**

Attribute Management (Read).

### **URL Parameters**

attributeTypeID: ID of the attribute type.

## **Request Body**

None.

## **Response Body**

```
AttributeID : int,
    AttributeTypeID : int,
    ParentAttributeID : int,
    ShortName : string,
    LongName : string,
    Description : string,
    ValueInt : int, // can be null
    IsReadOnly: bool,
},
...
]
```

200 - Request successful. Attributes in the response body.

For more information, please see "Common Response Codes" on page 16.

## **GET Attributes/{id}**

## **Purpose**

Returns an attribute definition by ID.

## **Required Permissions**

Attribute Management (Read).

#### **URL Parameters**

id: ID of the attribute.

## **Request Body**

None.

## **Response Body**

```
AttributeID : int,
AttributeTypeID : int,
ParentAttributeID : int, // can be null
ShortName : string,
LongName : string,
Description : string,
ValueInt : int, // can be null
IsReadOnly: bool,
ChildAttributes :
        AttributeID : int,
        AttributeTypeID : int,
        ParentAttributeID : int,
        ShortName : string,
        LongName : string,
        Description : string,
        ValueInt : int, // can be null
        IsReadOnly: bool,
    },
```

200 – Request successful. Attributes in the response body.

For more information, please see "Common Response Codes" on page 16.

## POST AttributeTypes/{attributeTypeID}/Attributes

## **Purpose**

Creates a new attribute definition by attribute type ID.

## **Required Permissions**

Attribute Management (Read/Write).

#### **URL Parameters**

attributeTypeID: ID of the attribute type.

### **Request Body**

Content-Type: application/json

```
ParentAttributeID : int, // can be null
ShortName : string,
LongName : string,
Description : string,
ValueInt : int // can be null
}
```

### **Request Body Details**

Max string length for ShortName and LongName is 64. Max string length for Description is 255.

### **Response Body**

Content-Type: application/json

```
AttributeID : int,
AttributeTypeID : int,
ParentAttributeID : int, // can be null
ShortName : string,
LongName : string,
Description : string,
ValueInt : int, // can be null
IsReadOnly: bool,
ChildAttributes :
        AttributeID : int,
        AttributeTypeID : int,
        ParentAttributeID : int,
        ShortName : string,
        LongName : string,
        Description : string,
        ValueInt : int, // can be null
        IsReadOnly: bool,
    },
]
```

## **Response Codes**

201 – Request successful. Attributes in the response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE Attributes/{id}**

### **Purpose**

Deletes an attribute definition by ID.

### **Required Permissions**

Attribute Management (Read/Write).

#### **URL Parameters**

id: ID of the attribute.

### **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

# Configuration

# **GET Configuration/Version**

### **Purpose**

Returns the current system version.

## **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
{
    Version : string
}
```

# **Response Codes**

200 - Request successful. Version model in the response body.

### **Databases**

### **Quick Navigation**

- "GET Databases" on page 86
- "GET Databases/{id}" on page 87
- "GET Assets/{id}/Databases" on page 88
- "POST Assets/{id}/Databases" on page 89
- "PUT Databases/{id}" on page 90
- "DELETE Databases/{id}" on page 91

For more information on related topics, please see:

- "Assets" on page 53
- "Platforms" on page 351
- "Managed Systems" on page 283

### **GET Databases**

## **Purpose**

Returns a list of databases.

## **Required Permissions**

Asset Management (Read).

## **Request Body**

None.

## **Response Body**

```
[
    AssetID: int,
    DatabaseID : int,
    PlatformID : int,
    InstanceName : string,
```

```
IsDefaultInstance : bool,
Port : int,
Version : string,
Template:string
},
...
```

201 – Request successful. Databases in the response body.

For more information, please see "Common Response Codes" on page 16.

## **GET Databases/{id}**

### **Purpose**

Returns a database by ID.

## **Required Permissions**

Asset Management (Read).

#### **URL Parameters**

id: ID of the database.

## **Request Body**

None.

## **Response Body**

```
AssetID:int,
DatabaseID: int,
PlatformID: int,
InstanceName: string,
IsDefaultInstance: bool,
Port: int,
```

```
Version : string }
```

201 - Request successful. Databases in the response body.

For more information, please see "Common Response Codes" on page 16.

## **GET Assets/{id}/Databases**

### **Purpose**

Returns a list of databases for the given asset.

### **Required Permissions**

Asset Management (Read).

#### **URL Parameters**

id: ID of the asset.

## **Request Body**

None.

## **Response Body**

```
AssetID: int,
DatabaseID : int,
PlatformID : int,
InstanceName : string,
IsDefaultInstance : bool,
Port : int,
Version : string,
Template:string
},
```

201 - Request successful. Databases in the response body.

For more information, please see "Common Response Codes" on page 16.

## POST Assets/{id}/Databases

### **Purpose**

Creates a new database in the asset referenced by ID.

## **Required Permissions**

Asset Management (Read/Write).

#### **URL Parameters**

id: ID of the asset.

## **Request Body**

Content-Type: application/json

```
PlatformID : int,
   InstanceName : string,
   IsDefaultInstance : bool,
   Port : int,
   Version : string,
   Template : string,
}
```

## **Request Body Details**

- PlatformID: (required) ID of the platform
- InstanceName: Name of the database instance. Required when IsDefaultInstance is false. Max string length is 100.
- IsDefaultInstance: True if the database instance is the default instance, otherwise false.

Note: Only MS SQL Server and MySQL platforms support setting this value to true.

- · Port: (required) The database port.
- Version: The database version. Max string value is 20.

• Template: The database connection template.

### **Response Body**

Content-Type: application/json

```
AssetID: int,
DatabaseID : int,
PlatformID : int,
InstanceName : string,
IsDefaultInstance : bool,
Port : int,
Version : string,
Template:string
}
```

## **Response Codes**

200 - Request successful. Databases in the response body.

For more information, please see "Common Response Codes" on page 16.

# PUT Databases/{id}

## **Purpose**

Updates an existing database by ID.

## **Required Permissions**

Asset Management (Read/Write).

#### **URL Parameters**

id: ID of the database.

## **Request Body**

```
{
    PlatformID: int,
    InstanceName: string,
```

```
IsDefaultInstance: bool,
Port: int,
Version: string,
Template: string
}
```

### **Request Body Details**

- PlatformID: (required) ID of the platform.
- InstanceName: Name of the database instance. Required when IsDefaultInstance is false. Max string length is 100.
- IsDefaultInstance: True if the database instance is the default instance, otherwise false.

Note: Only MS SQL Server and MySQL platforms support setting this value to true.

- · Port: The database port.
- Version: The database version. Max string length is 20.
- Template: The database connection template.

### **Response Body**

Content-Type: application/json

```
AssetID: int,
DatabaseID: int,
PlatformID: int,
InstanceName: string,
IsDefaultInstance: bool, Port: int,
Version: string,
Template: string
}
```

## **Response Codes**

200 - Request successful. Databases in the response body.

For more information, please see "Common Response Codes" on page 16.

## **DELETE Databases/{id}**

## **Purpose**

Deletes a database by ID.

## **Required Permissions**

Asset Management (Read/Write).

#### **URL Parameters**

id: ID of the database.

# **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

## **Entitlements**

## **Quick Navigation**

- "GET Entitlements" on page 93
- "GET Entitlements?groupIDs={groupID1,groupID2,groupID3...}" on page 94

### **GET Entitlements**

### **Purpose**

Returns user entitlements.

## **Required Permissions**

Analytics and Reporting (Read).

#### **URL Parameters**

None.

## **Request Body**

None.

## **Response Body**

```
{
    GroupID : int,
    Name : string,
    SmartRuleId : int,
    DistinguishedName : string,
    AccessLevel : string, // can be null
    RoleId : int,
    RoleName : string,
    DedicatedAccountPermissionOverride : string, // can be null
    DedicatedToAppUserID : int, // can be null
    DedicatedToAppUserName : string, // can be null
    IsAdministratorGroup : bool,
    UserID : int,
    UserName : string,
    ManagedAccountId : int,
```

```
AccountName : string,
RationalizedSystemName : string,
ApplicationName : string,
AccessPolicyName : string
}
```

## **GET Entitlements?groupIDs={groupID1,groupID2,groupID3...}**

### **Purpose**

Returns user entitlements for the specified group IDs.

### **Required Permissions**

Analytics and Reporting (Read).

#### **URL Parameters**

groupIDs: Comma separated list of group IDs

## **Request Body**

None.

## **Response Body**

```
{
    GroupID : int,
    Name : string,
    SmartRuleId : int,
    Title : string,
    SmartRuleType : string,
    AccessLevel : string, // can be null
    RoleId : int,
    RoleName : string,
    DedicatedAccountPermissionOverride : string, // can be null
    DedicatedToAppUserID : int, // can be null
    DedicatedToAppUserName : string, // can be null
    IsAdministratorGroup : bool,
    UserID : int,
    UserName : string,
```

```
ManagedAccountId : int,
    AccountName : string,
    RationalizedSystemName : string,
    ApplicationName : string,
    AccessPolicyName : string
}
```

## **Imports**

## **POST Imports**

## **Purpose**

Queues a third-party import.

## **Required Permissions**

Scan Management (Read/Write).

## **Request Body**

Content-Type: application/json

```
WorkgroupID: int,
ImportType: string,
Filter: string,
FileName: string,
FileContents: byte[],
Base64FileContents: string
}
```

Note: Provide either FileContents or Base64FileContents.

## **Request Body Details**

- WorkgroupID: ID of the Workgroup to import the assets into
- ImportType: (case-senstitive, default: PASSWORDSAFE) Type of import being queued:
  - PASSWORDSAFE: Password Safe import file. Expected file extension: .xml.
  - o RETINARTD: Retina@ RTD file. Expected file extension: .rtd.

**Note:** Support for the following file types has been deprecated and will be removed from the product in a future version.

- NESSUS: Nessus© import file. Expected file extension: .csv.
- NESSUSSECCEN: NessusSecurityCenter© import file. Expected file extension: .csv.
- NEXPOSE: Nexpose© import file. Expected file extension: .csv or .xml.
- QUALYSGUARD: QualysGuard© file. Expected file extension: .csv or .xml.

- METASPLOIT: METASPLOIT© import file. Expected file extension: .xml.
- MCAFEEVM: McAfee Vulnerability Management© import file. Expected file extension: .csv.
- TRIPWIRE: Tripwire© import file. Expected file extension: .csv.
- Filter: (default: All Assets) Asset selection filter:
  - o All Assets: No filter, import all.
  - o Single IPv4 address (i.e. 10.0.0.1).
  - IPv4 range (i.e. 10.0.0.1-10.0.0.5).
  - o CIDR (i.e. 10.0.0.0/24).
- FileName: Filename (including extension) of the import file. One of the following is required:
  - FileContents: The array containing the content of the import file.
  - Base64FileContents: Base64 string containing the content of the import file.

### **Response Body**

Content-Type: application/json

```
{
    ImportID: int
}
```

## **Response Codes**

200 - Request successful. Import ID in the response body.

# **Operating Systems**

## **GET Operating Systems**

### **Purpose**

Returns a list of operating systems.

### **Required Permissions**

Asset Management (Read).

## **Request Body**

None.

### **Response Body**

Content-Type: application/json

## **Response Codes**

200 - Request successful. Operating systems in the response body.

# **Organizations**

### **Quick Navigation**

- "GET Organizations" on page 99
- "GET Organizations/{id}" on page 100
- "GET Organizations?name={name}" on page 100

## **GET Organizations**

### **Purpose**

Returns a list of organizations to which the current user has permission.

### **Required Permissions**

Asset Management (Read).

### **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
[
    OrganizationID : string,
    Name : string,
    IsActive : bool
},
...
]
```

## **Response Codes**

200 - Request successful. Organizations in the response body.

## **GET Organizations/{id}**

### **Purpose**

Returns an organization by ID.

### **Required Permissions**

- · Current user has permission to the organization.
- · Asset Management (Read).

#### **URL Parameters**

id: ID of the organization.

## **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
{
   OrganizationID : string,
   Name : string,
   IsActive : bool
}
```

## **Response Codes**

200 - Request successful. Organizations in the response body.

For more information, please see "Common Response Codes" on page 16.

## **GET Organizations?name={name}**

## **Purpose**

Returns an organization by name.

## **Required Permissions**

- · Current user has permission to the organization
- · Asset Management (Read).

### **Query Parameters**

name: Name of the organization.

## **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
{
   OrganizationID : string,
   Name : string,
   IsActive : bool
}
```

## **Response Codes**

200 - Request successful. Organizations in the response body.

### **Permissions**

(i.e., Asset Management, User Accounts Management, Scan Management, etc.)

### **Quick Navigation**

- "GET Permissions" on page 102
- "User Group Permissions" on page 103
- "GET UserGroups/{userGroupID}/Permissions" on page 103
- "POST UserGroups/{userGroupId}/Permissions" on page 103
- "DELETE UserGroups/{userGroupId}/Permissions" on page 104

### **GET Permissions**

### **Purpose**

Returns a list of permissions.

### **Required Permissions**

User Accounts Management (Read).

## **Request Body**

None.

## **Response Body**

Content-Type: application/json

## **Response Codes**

200 - Request successful. Permissions in the response body.

# **User Group Permissions**

## **GET UserGroups/{userGroupID}/Permissions**

## **Purpose**

Gets all permissions for the user group referenced by ID.

## **Required Permissions**

User Accounts Management (Read).

#### **URL Parameters**

userGroupId: ID of the user group.

### **Request Body**

None.

## **Response Body**

Content-Type: application/json

## **Response Codes**

200 – Request successful. Permissions in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST UserGroups/{userGroupId}/Permissions

## **Purpose**

Sets permissions for the user group referenced by ID.

## **Required Permissions**

User Accounts Management (Read/Write).

#### Note:

- Adding the Secrets Safe feature/permission to a user group requires the caller to be an administrator.
- The access level for Secrets Safe cannot be changed to disabled if the group has associated secrets.

#### **URL Parameters**

userGroupId: ID of the user group.

### **Request Body**

Content-Type: application/json

## **Response Body**

None.

## **Response Codes**

204 - Request successful. No content in body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE UserGroups/{userGroupId}/Permissions**

## **Purpose**

Deletes all permissions for the user group referenced by ID.

## **Required Permissions**

User Accounts Management (Read/Write).

#### Note:

- Removing the Secrets Safe feature/permission from a user group requires the caller to be an administrator.
- Permissions for a User Group that has the Secrets Safe feature enabled cannot be deleted if the group has associated secrets.

#### **URL Parameters**

userGroupId: ID of the user group.

### **Request Body**

None.

### **Response Body**

None.

## **Response Codes**

200 - Request successful.

### **Smart Rules**

### **Quick Navigation**

- "GET SmartRules" on page 106
- "GET SmartRules/{id}" on page 107
- "GET UserGroups/{id}/SmartRules/" on page 108
- "GET SmartRules" on page 106
- "GET Organizations/{orgID}/SmartRules?title={title}" on page 110
- "POST SmartRules/FilterAssetAttribute" on page 111

- "DELETE SmartRules/{id}" on page 113
- "DELETE SmartRules?title={title}" on page 114
- "DELETE Organizations/{orgID}/SmartRules?title={title}" on page 115

For more information on related topics, please see:

- "Quick Rules" on page 363
- "Assets" on page 53
- "GET SmartRules/{id}/Assets" on page 70
- "Smart Rule Managed Accounts" on page 276
- "GET SmartRules/{smartRuleID}/ManagedAccounts" on page 276
- "GET QuickRules/{quickRuleID}/ManagedAccounts" on page 266
- "Managed Systems" on page 283
- "Smart Rule Managed Systems" on page 341

## **GET SmartRules**

## **Purpose**

Returns a list of Smart Rules to which the current user has at least read access.

## **Query Parameters**

type: (optional, default: all) Type of Smart Rules to return (all, managed account, managed system, and asset).

# **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
{
    SmartRuleID: int,
    OrganizationID : string, // can be null
    Title: string,
    Description: string,
    Category: string,
    Status: int,
    LastProcessedDate: datetime,
    IsReadOnly: bool,
    RuleType: string
},
...
]
```

### **Response Codes**

200 - Request successful. Smart Rule in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET SmartRules/{id}**

## **Purpose**

Returns a Smart Rule by ID.

## **Required Permissions**

Read access to the Smart Rule referenced by ID.

#### **URL Parameters**

id: ID of the Smart Rule.

# **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
SmartRuleID: int,
OrganizationID : string, // can be null
Title: string,
Description: string,
Category: string,
Status: int,
LastProcessedDate: datetime,
IsReadOnly: bool,
RuleType: string
}
```

### **Response Codes**

200 - Request successful. Smart Rule in the response body.

For more information, please see "Common Response Codes" on page 16.

## **GET UserGroups/{id}/SmartRules/**

## **Purpose**

Returns a list of Smart Rules to which the given user group ID has at least read access.

## Requirements

User Accounts Management (Read).

#### **URL Parameters**

id: ID of the user group.

## **Query Parameters**

accessLevel: (optional, default: 1,3) User group Smart Rule access level - A single value or comma-delimited list of values:

- 0: None.
- 1: Read.
- 3: Read/Write.

## **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
[{
    SmartRuleID: int,
    OrganizationID : string, // can be null
    Title: string,
    Description: string,
    Category: string,
    Status: int,
    LastProcessedDate: datetime,
    IsReadOnly: bool,
    RuleType: string,
    AccessLevelID: int,
}
,...
```

#### **Response Codes**

200 - Request successful. Smart Rules with user group access level in the response body.

## **GET SmartRules?title={title}**

## **Purpose**

Returns a Smart Rule by title.

In a multi-tenant environment, assumes global organization.

## Required permissions

Read access to the Smart Rule referenced by title.

# **Query Parameters**

title: Title of the Smart Rule.

## **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
SmartRuleID: int,
OrganizationID : string, // can be null
Title: string,
Description: string,
Category: string,
Status: int,
LastProcessedDate: datetime,
IsReadOnly: bool,
RuleType: string
}
```

#### **Response Codes**

200 - Request successful. Smart Rule in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Organizations/{orgID}/SmartRules?title={title}**

## **Purpose**

Returns a Smart Rule by organization ID and title. This is only valid in a multi-tenant environment.

## **Required Permissions**

Read access to the Smart Rule referenced by organization and title.

#### **URL Parameters**

orgID: ID of the organization.

## **Query Parameters**

title: Title of the Smart Rule.

## **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
SmartRuleID: int,
OrganizationID : string, // can be null
Title: string,
Description: string,
Category: string,
Status: int,
LastProcessedDate: datetime,
IsReadOnly: bool,
RuleType: string
}
```

### **Response Codes**

200 - Request successful. Smart Rule in the response body.

For more information, please see "Common Response Codes" on page 16.

#### POST SmartRules/FilterAssetAttribute

## **Purpose**

Specialized action for creating an asset type Smart Rule for filtering assets by attributes.

## **Required Permissions**

Asset Management (Read/Write).

# **Request Body**

```
AttributeIDs: [ int, ...],
Title: string,
Category: string,
Description: string,
ProcessImmediately: bool
}
```

### **Request Body Details**

- AttributeIDs: (required) A list of attribute IDs to filter by. All the attributes must be of the same attribute type.
- Title: (required) The title/name of the new Smart Rule. Must be unique across all Smart Rules. Max string length is 75.
- Category: (required) The category in which to place the Smart Rule. Max string length is 50.
- Description: (optional, default: <value of Title>) The Smart Rule description.
- **ProcessImmediately:** (optional, default: true) True to process the Smart Rule immediately, otherwise false to defer processing to the background Smart Rule processor.

#### **Response Body**

Content-Type: application/json

```
SmartRuleID: int,
OrganizationID : string, // can be null
Title: string,
Description: string,
Category: string,
Status: int,
LastProcessedDate: datetime,
IsReadOnly: bool
}
```

## **Response Codes**

201 - Request successful. Smart Rule in response body.

For more information, please see "Common Response Codes" on page 16.

# POST SmartRules/{id}/Process

## **Purpose**

Process a Smart Rule by ID.

## **Required Permissions**

Read/Write access to the Smart Rule.

#### **URL Parameters**

ID: ID of the Smart Rule.

### **Query Parameters**

Queue: (default: false) True to queue the Smart Rule for processing; false to process the Smart Rule immediately.

### **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
SmartRuleID: int,
OrganizationID : string, // can be null
Title: string,
Description: string,
Category: string,
Status: int,
LastProcessedDate: datetime,
IsReadOnly: bool,
RuleType: string
}
```

## **Response Codes**

- 200 Request successful. Smart Rule in the response body.
- 409 Conflict: the Smart Rule is currently processing.

For more information, please see "Common Response Codes" on page 16.

# **DELETE SmartRules/{id}**

## **Purpose**

Deletes a Smart Rule by ID.

# **Required Permissions**

Read/Write access to the Smart Rule referenced by ID

#### **URL Parameters**

ID: ID of the Smart Rule.

## **Request Body**

None.

### **Response Body**

None.

#### **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

## **DELETE SmartRules?title={title}**

#### **Purpose**

Deletes a Smart Rule by title.

In a multi-tenant environment, assumes global organization.

## **Required Permissions**

Read/Write access to the Smart Rule referenced by title.

# **Query Parameters**

title: Title of the Smart Rule.

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **DELETE Organizations/{orgID}/SmartRules?title={title}**

### **Purpose**

Deletes a Smart Rule by organization ID and title.

Only valid in a multi-tenant environment.

### **Required permissions**

Read/Write access to the Smart Rule referenced by organization and title.

#### **URL Parameters**

orgID: ID of the organization.

### **Query Parameters**

title: Title of the Smart Rule.

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **Subscription Delivery (Cloud Only)**

### **Quick Navigation**

- "GET Subscriptions/Delivery" on page 116
- "POST Subscriptions/Delivery/download?id={id}" on page 117

## **GET Subscriptions/Delivery**

## **Purpose**

Returns a list of IDs for all subscription deliveries that a user has access to. Administrators have access to all deliveries while other users only have access to deliveries they created.

#### **Required Permissions**

Analytics and Reporting (Read).

#### **URL Parameters**

None.

# **Request Body**

None.

## **Response Body**

Content-Type: application/json

## **Response Body Details**

A list of ints that reference the ReportDeliveryId field for every subscription delivery that the user has access to.

## **Response Codes**

200 - Request successful. Ids in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST Subscriptions/Delivery/download?id={id}

### **Purpose**

Returns the subscription delivery for the requested id.

#### **Required Permissions**

Analytics and Reporting (Read).

#### **URL Parameters**

id: ID of the request for which to retrieve the subscription delivery.

#### **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
[
    ReportDeliveryId : int,
    ScheduleId : int,
    Filename : string,
    ApplicationType : string,
    Snapshot : string,
}
```

# **Response Body Details**

- ReportDeliveryId: The ID of this subscription delivery in the database.
- Scheduleld: Schedule ID of the subscription associated with this subscription delivery.
- ApplicationType: The MIME type string identifying the format of the file. Will be one of the following:
  - o application/msword (Word)
  - o application/vnd.openxmlformats-officedocument.spreadsheetml.sheet (Excel)

- o application/pdf (Pdf)
- o image/tiff (TIFF)
- text/csv (CSV)
- Snapshot: A Base64 string representing the byte array of the subscription delivery file itself.

### **Response Codes**

200 – Request successful. Subscription delivery in the response body.

For more information, please see "Common Response Codes" on page 16.

# **User Groups**

### **Quick Navigation**

- "GET UserGroups" on page 119
- "GET UserGroups/{id}" on page 120
- "GET UserGroups?name={name}" on page 121
- "POST UserGroups" on page 122
- "DELETE UserGroups/{id}" on page 125
- "DELETE UserGroups?name={name}" on page 126

## **GET UserGroups**

## **Purpose**

Returns a list of active and inactive user groups.

## **Required Permissions**

User Accounts Management (Read).

## **Request Body**

None.

## **Response Body**

```
{
    GroupID : int,
    Name : string,
    DistinguishedName : string,
    Description : string,
    GroupType : string,
    AccountAttribute : string,
    ApplicationRegistrationIDs : string,
    MembershipAttribute : string,
    IsActive : bool
},
...
]
```

### **Response Codes**

200 - Request successful. User group in the response body.

For more information, please see "Common Response Codes" on page 16.

## **GET UserGroups/{id}**

#### **Purpose**

Returns a user group by ID.

## **Required Permissions**

User Accounts Management (Read).

#### **URL Parameters**

id: ID of the user group.

## **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
{
    GroupID : int,
    Name : string,
    DistinguishedName : string,
    Description : string,
    GroupType : string,
    AccountAttribute : string,
    ApplicationRegistrationIDs : string,
    MembershipAttribute : string,
    IsActive : bool
}
```

## **Response Codes**

200 - Request successful. User group in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET UserGroups?name={name}**

### **Purpose**

Returns a user group by name.

### **Required Permissions**

User Accounts Management (Read).

## **Query Parameters**

name: Name of the user group.

### **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
[
    GroupID : int,
    Name : string,
    DistinguishedName : string,
    GroupType : string,
    AccountAttribute : string,
    ApplicationRegistrationIDs : string,
    MembershipAttribute : string,
    IsActive : bool
}
```

## **Response Codes**

200 - Request successful. User group in the response body.

For more information, please see "Common Response Codes" on page 16.

## **POST UserGroups**

#### **Purpose**

Creates a new user group with permissions, and, optionally, Smart Rule access and application registration IDs.

#### **Required Permissions**

User Accounts Management (Read/Write).

**Note:** Creating a user group that has the Secrets Safe feature/permission enabled requires the caller to be an administrator.

### **Request Body**

The request body differs for the different group types available: BeyondInsight, ActiveDirectory, LdapDirectory.

#### **BeyondInsight Group Type**

#### **Request Body**

Content-Type: application/json

```
groupType : string = "BeyondInsight",
  groupName : string,
  description : string,
  isActive : bool,
  Permissions : [ { PermissionID: int, AccessLevelID: int }, ... ],
  SmartRuleAccess : [ { SmartRuleID: int, AccessLevelID: int }, ... ],
  ApplicationRegistrationIDs: [ int, ... ]
```

## **Request Body Details**

- groupName: (required) Name of the BeyondInsight user group. Max string length is 200.
- description: (required) Description of the user group. Max string length is 255.

For more information, please see "Common Request Body Details" on page 124.

### **ActiveDirectory Group Type**

#### **Request Body**

Content-Type: application/json

```
groupType : string = "ActiveDirectory",
groupName : string,
forestName : string,
domainName : string,
description : string,
bindUser : string,
bindPassword : string,
useSSL : bool,
isActive : bool,
ExcludedFromGlobalSync : bool,
OverrideGlobalSyncSettings : bool,
Permissions : [ { PermissionID: int,
AccessLevelID: int }, ... ],
SmartRuleAccess : [ { SmartRuleID: int, AccessLevelID: int }, ... ],
ApplicationRegistrationIDs: [ int, ... ]
```

### **Request Body Details**

- groupName: (required) Name of the Active Directory group. Max string length is 200.
- domainName: (required) The directory domain name. Max string length is 250.
- description: (required) Description of the user group. Max string length is 255.
- bindUser: Username for directory binding. If not given, attempts to use existing credentials for the directory. If specifying an
  existing credential, you also need Credential Management Read. If specifying a new credential, you also need Credential
  Management Read/Write.
  - o bindPassword: Password for directory binding (required if bindUser is given).
  - o forestName: The directory forest name (required when bindUser is given). Max string length is 300.
- useSSL: (default: false) Flag indicating whether to use SSL.
- **ExcludedFromGlobalSync:** (default false) Flag indicating if the Active Directory group uses the global group synchronization settings.
- OverrideGlobalSyncSettings: (default false) Flag indicating if the Active Directory group overrides the global group synchronization settings.

For more information, please see "Common Request Body Details" on page 124.

TC: 11/7/2023

### **LdapDirectory Group Type**

#### **Request Body**

Content-Type: application/json

```
groupType : string = "LdapDirectory",
   groupName : string,
   groupDistinguishedName : string,
   hostName : string,
   bindUser : string,
   bindPassword : string,
   port : int,
   useSSL : bool,
   membershipAttribute : string,
   accountAttribute : string,

   isActive : bool,
   Permissions : [ { PermissionID: int,
   AccessLevelID: int }, ... ],
   SmartRuleAccess : [ { SmartRuleID: int, AccessLevelID: int }, ... ],
   ApplicationRegistrationIDs: [ int, ... ]
```

#### **Request Body Details**

- groupName: (required) Name of the LDAP group. Max string length is 200.
- groupDistinguishedName: (required) Distinguished name of the LDAP group. Max string length is 500.
- hostName: (required) The directory server host name or IP. Max string length is 50.
- bindUser: Username for directory binding. If not given, attempts to use existing credentials for the directory. If specifying an
  existing credential, you also need Credential Management Read. If specifying a new credential, you also need Credential
  Management Read/Write.
  - bindPassword: Password for directory binding (Note: required if bindUser is given).
  - o port: Directory server port (valid range: 1 to 65535) (required if bindUser is given).
  - useSSL: (default: false) Flag indicating whether to use SSL (required if bindUser is given).
- membershipAttribute: (required) Directory group membership attribute. Max string length is 255.
- accountAttribute: (required) Directory account naming attribute. Max string length is 255.

For more information, please see "Common Request Body Details" on page 124.

#### **Common Request Body Details**

- isActive: (default: true) True if the group should be created as active, otherwise false.
- **Permissions:** One or more permissions and access levels to set for the new user group.

- SmartRuleAccess: One or more Smart Rules and access levels to set for the new user group.
- ApplicationRegistrationIDs: Zero or more IDs representing the API application registrations to grant the new user group. If given, enables API for the user group.

#### **Response Body**

Content-Type: application/json

```
{
   GroupID : int, Name : string,
   DistinguishedName : string,
   Description : string,
   GroupType : string,
   AccountAttribute : string,
   MembershipAttribute : string,
   IsActive : bool
}
```

#### **Response Codes**

201 - Request successful. User group in the response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE UserGroups/{id}**

## **Purpose**

Deletes a user group by ID.

## **Required Permissions**

User Accounts Management (Read/Write).

#### Note:

- Deleting a user group that has the Secrets Safe feature/permission enabled requires the caller to be an administrator.
- User Groups that have the Secrets Safe feature enabled cannot be deleted if the group has associated secrets.

#### **URL Parameters**

id: ID of the user group.

# **Request Body**

None.

## **Response Body**

None.

### **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

## **DELETE UserGroups?name={name}**

#### **Purpose**

Deletes a user group by name.

## **Required Permissions**

User Accounts Management (Read/Write).

Note: Deleting a user group that has the Secrets Safe feature/permission enabled requires the caller to be an administrator.

## **Query Parameters**

name: Name of the user group.

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **User Group Memberships**

### **Quick Navigation**

- "GET Users/{userID}/UserGroups" on page 128
- "POST Users/{userID}/UserGroups/{userGroupID}" on page 129
- "DELETE Users/{userID}/UserGroups/{userGroupID}" on page 130

## **GET Users/{userID}/UserGroups**

#### **Purpose**

Returns the user group memberships for an existing user.

### **Required Permissions**

User Accounts Management (Read).

#### **URL Parameters**

userID: ID of the user.

# **Request Body**

None.

## **Response Body**

```
[
    GroupID : int,
    Name : string,
    DistinguishedName : string,
    GroupType : string,
    AccountAttribute : string,
    MembershipAttribute : string,
    IsActive : bool
},
...
]
```

### **Response Codes**

200 - Request successful. User group in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST Users/{userID}/UserGroups/{userGroupID}

# **Purpose**

Adds an existing user to a user group.

## **Required Permissions**

User Accounts Management (Read/Write).

#### **URL Parameters**

- userID: ID of the user.
- · userGroupID: ID of the user group.

# **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
GroupID : int, Name : string,
DistinguishedName : string,
GroupType : string,
AccountAttribute : string,
MembershipAttribute : string,
IsActive : bool
}
```

## **Response Codes**

201 – Request successful. User group in the response body.

For more information, please see "Common Response Codes" on page 16.

# DELETE Users/{userID}/UserGroups/{userGroupID}

### **Purpose**

Removes a user from a user group.

### **Required Permissions**

User Accounts Management (Read/Write).

#### **URL Parameters**

- userID: ID of the user.
- userGroupID: ID of the user group.

### **Request Body**

None.

## **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

## **User Audits**

#### **GET UserAudits**

### **Purpose**

Returns a list of user audits.

## **Required Permissions**

User Audit Management (Read).

# **Query Parameters (Optional)**

username: User name.actiontype: Action type.

section: Section.startdate: Start date.enddate: End date.

• limit: (default: 1000) Number of records to return.

• offset: (default: 0) Number of records to skip before returning records.

## **Request Body**

None.

## **Response Body**

```
TotalCount : int,
Data: [
{
   AuditID : int,
   ActionType : string,
   Section : string,
   UserID : int,
   UserName : string,
   IPAddress : string,
   CreateDate : datetime
},
   ...
```

]
}

## **Response Codes**

200 - Request successful. User Audits in response body.

#### **Default Sort**

By default the records are sorted by CreateDate in descending order (latest entries are shown first)

# **GET UserAudits/{auditId:int}/UserAuditDetails**

#### **Purpose**

Returns a list of user audit details.

# **Required Permissions**

User Audit Management (Read).

# **Query Parameters**

- · auditid: Audit ID
- limit: (default: 1000) Number of records to return.
- offset: (default: 0) Number of records to skip before returning records.

## **Request Body**

None.

## **Response Body**

```
TotalCount: int,
Data: [
{
   AuditDetailsID : int,
   Name: string,
   OldValue : string,
   NewValue : string
```

```
},
...
1
```

## **Users**

### **Quick Navigation**

- "GET Users" on page 134
- "GET UserGroups/{userGroupId}/Users" on page 136
- "GET Users/{id}" on page 137
- "POST Users" on page 138
- "POST Users/{id}/Quarantine" on page 141
- "POST UserGroups/{userGroupId}/Users" on page 142
- "PUT Users/{id}" on page 144
- "DELETE Users/{id}" on page 146
- "POST/{id}/Users/{id}/RecycleClientSecret" on page 143

#### **GET Users**

#### **Purpose**

Returns a list of all users if username parameter is not supplied. Otherwise returns the requested user.

Note: Some usernames may be in the format hostname\username, if not represented by an email address.

## **Required Permissions**

User Accounts Management (Read).

## **Query Parameters (Optional)**

username: The user to return, in one of following formats:

- · username: returns the BeyondInsight users.
- domain\username or universal principal name: returns Active Directory or LDAP users.

**Note:** A **username** search without a domain finds local users; if domain is added to the search, it finds the user for a given domain.

Note: Use of the optional query parameters results in the supplied value being recorded in the web server log file.

**API GUIDE** 

## **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
{
    UserID : int,
    UserName : string,
    DomainName : string,
    DistinguishedName : string,
    FirstName : string,
    LastName : string,
    LastLoginDate : DateTime,
    LastLoginAuthenticationType : string,
    LastLoginConfigurationName : string,
    LastLoginSAMLIDPURL : string,
    LastLoginSSOURL : string,
    IsQuarantined: bool
},
...
```

### **Application User Type:**

**Note: ClientSecret** has no value; it can only be retrieved via API by initial creation or recycling it. Please see "Users" on page 134.

```
{
   ClientID: string,
   ClientSecret: string = null,
   AccessPolicyID: int,
   UserID: int,
   UserType: string = "Application",
   UserName: string,
   DomainName: string = null,
   DistinguishedName: string = null,
   FirstName: string = null,
   LastName: string = null,
   EmailAddress: string = null,
   IsQuarantined: bool
}
```

### **Response Codes**

200 - Request successful. Users in the response body.

For more information, please see "Common Response Codes" on page 16.

## GET UserGroups/{userGroupId}/Users

#### **Purpose**

Returns a list of users for the user group referenced by ID.

### **Required Permissions**

User Accounts Management (Read).

#### **URL Parameters**

userGroupId: ID of the user group.

## **Request Body**

None.

## **Response Body**

```
UserID : int,
    UserName : string,
    DomainName : string,
    DistinguishedName : string,
    FirstName : string,
    LastName : string,
    EmailAddress : string,
    LastLoginDate : DateTime,
    LastLoginAuthenticationType : string,
    LastLoginSAMLIDPURL : string,
    LastLoginSSOURL : string,
    LastLoginSSOURL : string,
    IsQuarantined: bool
},
```

... ]

### **Response Codes**

200 - Request successful. Users in the response body.

For more information, please see "Common Response Codes" on page 16.

## **GET Users/{id}**

#### **Purpose**

Returns a user by ID.

## **Required Permissions**

User Accounts Management (Read).

#### **URL Parameters**

id: ID of the user.

## **Request Body**

None.

## **Response Body**

```
[
{
   UserID : int,
   UserName : string,
   DomainName : string,
   DistinguishedName : string,
   FirstName : string,
   LastName : string,
   LastLoginDate : DateTime,
   LastLoginAuthenticationType : string,
   LastLoginConfigurationName : string,
   LastLoginSAMLIDPURL : string,
```

```
LastLoginSSOURL : string,
   IsQuarantined: bool
}
```

#### **Application User Type**

**Note: ClientSecret** has no value; it can only be retrieved via API by initial creation or recycling it. Please see "Users" on page 134.

```
ClientID: string,
ClientSecret: string = null,
AccessPolicyID: int,
UserID: int,
UserType: string = "Application",
UserName: string,
DomainName: string = null,
DistinguishedName: string = null,
FirstName: string = null,
LastName: string = null,
EmailAddress: string = null,
IsQuarantined: bool
}
```

## **Response Codes**

200 - Request successful. User in the response body.

For more information, please see "Common Response Codes" on page 16.

## **POST Users**

## **Purpose**

Creates a new user with no user group associations.

## **Required Permissions**

User Accounts Management (Read/Write).

## **Request Body**

The request body differs for the different user types available: BeyondInsight, ActiveDirectory, LdapDirectory

#### **BeyondInsight User Type**

Content-Type: application/json

```
UserType : string = "BeyondInsight",
UserName : string,
FirstName : string,
LastName : string,
EmailAddress : string,
Password : string
}
```

#### **Request Body Details**

- UserName: (required) Username of the user account. Max string length is 64.
- FirstName: (required) First name of the user. Max string length is 64.
- LastName: (optional) Last name of the user. Max string length is 64.
- EmailAddress: (required must be a properly formatted address) Email address for the user. Max string length is 255.
- Password: (required) The password they would use to login to BeyondInsight.

#### **ActiveDirectory User Type**

Content-Type: application/json

```
UserType : string = "ActiveDirectory",
UserName : string,
ForestName : string,
DomainName : string,
BindUser : string,
BindPassword : string,
UseSSL : bool,
}
```

#### **Request Body Details**

- UserName: (required) Name of the Active Directory user. Max string length is 64.
- DomainName: (required) The directory domain name. Max string length is 250.
- · BindUser: Username for directory binding. If not given, attempts to use existing credentials for the directory.
  - BindPassword: Password for directory binding (required when BindUser is given).
  - ForestName: The directory forest name (required when BindUser is given). Max string length is 300.
- UseSSL: (default: false) Flag indicating whether to use SSL.

#### **LdapDirectory User Type**

Content-Type: application/json

```
UserType: string = "LdapDirectory",
HostName: string,
DistinguishedName: string,
AccountNameAttribute: string,
BindUser: string,
BindPassword: string,
Port: int,
UseSSL: bool
}
```

#### **Request Body Details**

- HostName: (required) The directory server host name or IP.
- DistinguishedName: (required) The DistinguishedName of the user to create. Max string length is 255.
- AccountNameAttribute: (required) The LDAP attribute to use for creating the username.
- · BindUser: Username for directory binding. If not given, attempts to use existing credentials for the directory.
  - BindPassword: Password for directory binding. (required if BindUser is given).
  - Port: The directory server port. (used when BindUser and BindPassword are given).
  - UseSSL: Flag indicating whether to use SSL (used when BindUser and BindPassword are given).

#### **Application User Type**

```
{
   UserType: string = "Application",
   UserName: string,
   AccessPolicyID: int
}
```

For more information, please see "Common Request Body Details" on page 124.

## **Response Body**

```
[
    UserID : int,
    UserName : string,
    DomainName : string,
```

```
DistinguishedName : string,
  FirstName : string,
  LastName : string,
  EmailAddress : string,
  IsQuarantined: bool
}
```

#### **Application User Type**

```
{
   ClientID: string,
   ClientSecret: string,
   AccessPolicyID: int,
   UserID: int,
   UserType: string = "Application",
   UserName: string,
   DomainName: string = null,
   DistinguishedName: string = null,
   FirstName: string = null,
   LastName: string = null,
   EmailAddress: string = null,
   IsQuarantined: bool
}
```

## **Response Codes**

200 – Request successful. User in the response body.

For more information, please see "Common Response Codes" on page 16.

## POST Users/{id}/Quarantine

## **Purpose**

Quarantines the user referenced by ID.

## **Required Permissions**

Password Safe API Global Quarantine (Read/Write).

#### **URL Parameters**

id: ID of the BeyondInsight user.

## **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
UserID : int,
UserName : string,
DomainName : string,
DistinguishedName : string,
FirstName : string,
LastName : string,
EmailAddress : string,
IsQuarantined: bool
}
```

### **Response Codes**

200 - Request successful. User in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST UserGroups/{userGroupId}/Users

## **Purpose**

Creates a user in a BeyondInsight-type user group.

## **Required Permissions**

User Accounts Management (Read/Write).

#### **URL Parameters**

userGroupId: ID of the user group.

## **Request Body**

```
UserName : string,
FirstName : string,
LastName : string,
EmailAddress : string,
Password : string
}
```

#### **Request Body Details**

- UserName: (required) Username of the user account. Max string length is 64.
- FirstName: (required) First name of the user. Max string length is 64.
- LastName: (optional) Last name of the user. Max string length is 64.
- EmailAddress: (required and must be a properly formatted address) Email address for the user. Max string length is 255.
- Password: (required) The password they would use to login to BeyondInsight.

#### **Response Body**

Content-Type: application/json

```
[
{
    UserID : int,
    UserName : string,
    DomainName : string,
    DistinguishedName : string,
    FirstName : string,
    LastName : string,
    EmailAddress : string,
    IsQuarantined: bool
}
```

## **Response Codes**

201 - Request successful. User in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST/{id}/Users/{id}/RecycleClientSecret

Note: For application user type only.

## **Purpose**

Recycles the client secret for an application user.

### **Required Permissions**

User Accounts Management (Read/Write) or logged in as the user being affected.

## **Request Body**

None.

### **Response Body**

Content-Type: application/json

string

#### **Response Codes**

200 - Request successful. New client secret in the body.

For more information, please see "Common Response Codes" on page 16.

# PUT Users/{id}

## **Purpose**

Updates a BeyondInsight user by ID.

Note: Cannot update ActiveDirectory or LDAP users.

## **Required Permissions**

User Accounts Management (Read/Write).

#### **URL Parameters**

id: ID of the BeyondInsight user.

### **Request Body**

Content-Type application/json

```
UserName : string,
FirstName : string,
LastName : string,
EmailAddress : string,
Password: string
}
```

#### **Request Body Details**

- UserName: (required) Username of the user account.
- FirstName: (required) First name of the user.
- · LastName: (optional) Last name of the user.
- EmailAddress: (required and must be a properly formatted address) Email address for the user.
- Password: (optional) The password they would use to log in to BeyondInsight. If given, replaces the current password.

#### **Application User Type**

```
{
    UserName: string,
    AccessPolicyID: int
}
```

# **Response Body**

```
UserID : int,
UserName : string,
DomainName : string,
DistinguishedName : string,
FirstName : string,
LastName : string,
EmailAddress : string,
IsQuarantined: bool
}
```

#### **Application User Type**

**Note: ClientSecret** has no value; it can only be retrieved via API by initial creation or recycling it. Please see "Users" on page 134.

```
ClientID: string,
ClientSecret: string = null,
AccessPolicyID: int,
UserID: int,
UserType: string = "Application",
UserName: string,
DomainName: string = null,
DistinguishedName: string = null,
FirstName: string = null,
LastName: string = null,
EmailAddress: string = null,
IsQuarantined: bool
}
```

#### **Response Codes**

200 - Request successful. User in the response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE Users/{id}**

### **Purpose**

Deletes a user by ID.

# **Required Permissions**

User Accounts Management (Read/Write).

#### Note:

- Users that have the Secrets Safe feature enabled cannot be deleted if that user is the only owner of at least one secret.
- If the user is not the sole owner of any secrets, but is one of multiple owners of a secret, then no error will be presented and the user can be deleted successfully. They will also be removed from the secrets they are part owners to.

#### **URL Parameters**

id: ID of the user.

# **Request Body**

None.

# **Response Codes**

200 - Request successful.

# Workgroups

# **Quick Navigation**

- "GET Workgroups" on page 148
- "GET Workgroups/{id}" on page 149
- "GET Workgroups?name={name}" on page 149
- "POST Workgroups" on page 150

# **GET Workgroups**

### **Purpose**

Returns a list of Workgroups to which the current user has permission.

### **Request Body**

None.

# **Response Body**

Content-Type: application/json

```
[
          OrganizationID : string, ID : int,
          Name : string
},
...
]
```

# **Response Codes**

200 - Request successful. Workgroups in the response body.

# **GET Workgroups/{id}**

#### **Purpose**

Returns a Workgroup by ID.

# **Required Permissions**

- · Current user has permission to the Workgroup Organization.
- · Asset Management (Read) or Scan Management (Read/Write).

### **Query Parameters**

id: ID of the Workgroup.

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

```
{
   OrganizationID : string,
   ID : int,
   Name : string
}
```

# **Response Codes**

200 - Request successful. Workgroups in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Workgroups?name={name}**

# **Purpose**

Returns a Workgroup by name.

# **Required Permissions**

Current user has permission to the Workgroup Organization. Asset Management (Read) or Scan Management (Read/Write).

### **Query Parameters**

name: Name of the Workgroup.

# **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
{
   OrganizationID : string,
   ID : int,
   Name : string
}
```

# **Response Codes**

200 - Request successful. Workgroups in the response body.

For more information, please see "Common Response Codes" on page 16.

# **POST Workgroups**

# **Purpose**

Creates a Workgroup.

# **Required Permissions**

Asset Management (Read/Write).

# **Request Body**

```
{
   OrganizationID: string,
   Name : string
}
```

### **Request Body Details**

- Organization ID: (optional) The ID of the organization in which to place the new Workgroup. If empty, the Workgroup is placed in the default organization.
- Name: The name of the Workgroup. Max string length is 256.

### **Response Body**

Content-Type: application/json

```
{
   OrganizationID : string,
   ID : int,
   Name : string
}
```

### **Response Codes**

201 – Request successful. Workgroups in the response body.

# **Deprecated**

The content in this section of the guide has been deprecated and is compatible with earlier versions only.

#### **Quick Navigation**

- "[deprecated] POST Imports/QueueImportFile" on page 152
- "[deprecated] POST SmartRules/FilterSingleAccount" on page 153
- "[deprecated] GET UserGroups/{name}" on page 155
- "[deprecated] DELETE UserGroups/{name}" on page 156
- "[deprecated] GET Workgroups/{name}" on page 156

### **Imports**

### [deprecated] POST Imports/QueueImportFile

**Note:** This API has been deprecated and is available for backwards compatibility only. Use **POST Imports with Base64FileContents** instead.

#### **Purpose**

Queues a Password Safe XML import using multi-part form-data content.

#### **Required Permissions**

Scan Management (Read/Write).

#### **Request Body**

Content-Type: multipart/form-data

```
{
    Content-type: application/json
    {
        WorkgroupID: int,
        FileName: string
}
    application/octet-stream
{
        <string-encoded byte array representing the file>
}
}
```

#### **Request Body Details**

- WorkgroupID: ID of the Workgroup to import the assets into.
- FileName: Filename (including extension) of the import file.

#### **Response Body**

Content-Type: application/json

```
{
    ImportID: int
}
```

#### **Response Codes**

- 200 Request successful. Import ID in the response body.
- 400 The import file was not found in the body of the request, or a request body validation error has occurred.

#### **Smart Rules**

### [deprecated] POST SmartRules/FilterSingleAccount

Note: This API has been deprecated and is available for backwards compatibility only. Use QuickRules instead.

#### **Purpose**

Specialized action for creating a Managed Account-type Smart Rule for filtering a single Managed Account by System Name and Account Name

#### **Required Permissions**

Smart Rule Management - Managed Account (Read/Write).

#### **Request Body**

```
{
    AccountID: int,
    Title: string
}
```

#### **Request Body Details**

- AccountID: (required) ID of the managed account you want to filter by parent System Name and Account Name.
- Title: (optional) The title/name of the new Smart Rule. If omitted, a unique title is auto-generated.

#### **Response Body**

Content-Type: application/json

```
SmartRuleID: int,
OrganizationID : string, // can be null
Title: string,
Description: string,
Category: string,
Status: int,
LastProcessedDate: datetime,
IsReadOnly: bool,
RuleType: string
}
```

#### **Response Codes**

201 - Request successful. Smart Rule in the response body.

# **User Groups**

### [deprecated] GET UserGroups/{name}

**Note:** This API has been deprecated and is available for backwards compatibility only. Use **GET UserGroups?name=** {name} instead.

#### **Purpose**

Returns a user group by name.

#### **Required Permissions**

User Accounts Management (Read).

#### **URL Parameters**

name: Name of the user group.

#### Request Body

None.

#### **Response Body**

Content-Type: application/json

```
GroupID : int, Name : string,
DistinguishedName : string,
GroupType : string,
AccountAttribute : string,
MembershipAttribute : string,
IsActive : bool
}
```

#### **Response Codes**

200 - Request successful. User group in the response body.

# [deprecated] DELETE UserGroups/{name}

**Note:** This API has been deprecated and is available for backwards compatibility only. **Use DELETE UserGroups?name= {name}** instead.

#### **Purpose**

Deletes a user group by name.

#### **Required Permissions**

User Accounts Management (Read/Write).

#### **URL Parameters**

name: Name of the user group.

#### **Request Body**

None.

#### **Response Body**

None.

#### **Response Codes**

200 - Request successful.

# Workgroups

# [deprecated] GET Workgroups/{name}

**Note:** This API has been deprecated and is available for backwards compatibility only. Use **GET Workgroups?name=** {name} instead.

#### **Purpose**

Returns a Workgroup by name.

#### **Required Permissions**

Current user has permission to the Workgroup Organization. Asset Management (Read) or Scan Management (Read/Write).

#### **Query Parameters**

name: Name of the Workgroup.

#### **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
{
   OrganizationID : string,
   ID : int,
   Name : string
}
```

#### **Response Codes**

200 - Request successful. Workgroups in the response body.

# **Password Safe APIs**

The Password Safe APIs require a valid Password Safe license.

### **Access Policies**

# **Quick Navigation**

- "GET AccessPolicies" on page 159
- "POST AccessPolicies/Test" on page 160

#### **GET AccessPolicies**

# **Purpose**

Returns a list of Password Safe access policies.

### **Required Permissions**

Password Safe Role Management (Read).

# **Request Body**

None.

# **Response Body**

```
...
},
...
1
},
...
1
```

200 - Request successful. Access policies in response body.

For more information, please see "Common Response Codes" on page 16.

#### **POST AccessPolicies/Test**

### **Purpose**

Tests access to a managed account and returns a list of Password Safe access policies that are available in the request window.

### **Required Roles**

Requestor role.

# **Request Body**

Content-Type: application/json

```
{
    SystemId: int,
    AccountId: int,
    DurationMinutes : int
}
```

# **Response Body**

```
[
AccessPolicyID:int,
Name:string,
Description:string,
```

- 200 Request successful. Access policies in response body.
- 403 User does not have permissions to request the indicated account or the account does not have API access enabled. Response body contains a status code indicating the reason for this forbidden access:
  - 4031 User does not have permission to request the account or the account is not valid for the system.

### **Aliases**

### **Quick Navigation**

- "GET Aliases" on page 162
- "GET Aliases/{id}" on page 163
- "GET Aliases?name={name}" on page 164

#### **GET Aliases**

### **Purpose**

Returns a list of requestable managed account aliases.

### **Required Roles**

Requestor or Requestor/Approver role for the preferred managed account referenced by the alias.

#### **Query Parameters**

- state (optional, default: 1, 2): Zero or more state values, i.e., 'state=2', 'state=1,2', 'state=0,1,2'.
  - **0:** Unmapped
  - 1: Mapped
  - o 2: Highly Available

Note: Only Aliases with a mapped state of 1 or 2 can be used for API POST Aliases/{id}/Requests.

# **Request Body**

None.

# **Response Body**

```
[
AliasId: int,
AliasName: string,
AliasState: int,
```

```
SystemId: int,
SystemName: string,
AccountId: int,
AccountName: string,
DomainName: string,
InstanceName: string,
DefaultReleaseDuration: int,
MaximumReleaseDuration: int,
LastChangeDate: datetime,
NextChangeDate: datetime,
IsChanging: bool,
ChangeState: int,
MappedAccounts :
        AliasID: int,
        ManagedSystemID: int,
        ManagedAccountID: int,
        Status: string
    },
```

200 - Request successful. Aliases in response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Aliases/{id}**

### **Purpose**

Returns a requestable managed account alias by ID.

### **Required Roles**

Requestor or Requestor/Approver role for the preferred managed account referenced by the alias.

#### **URL Parameters**

id: ID of the managed account alias.

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

```
AliasId: int,
AliasName: string,
AliasState: int,
SystemId: int,
SystemName: string,
AccountId: int,
AccountName: string,
DomainName: string,
InstanceName: string,
DefaultReleaseDuration: int,
MaximumReleaseDuration: int,

    },
```

# **Response Codes**

200 - Request successful. Alias in response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Aliases?name={name}**

### **Purpose**

Returns a requestable managed account alias by name.

# **Required Roles**

Requestor or Requestor/Approver role for the preferred managed account referenced by the alias.

#### **URL Parameters**

name: Name of the managed account alias.

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

```
AliasId: int,
AliasName: string,
AliasState: int,
SystemId: int,
SystemName: string,
AccountId: int,
AccountName: string,
DomainName: string,
InstanceName: string,
DefaultReleaseDuration: int,
MaximumReleaseDuration: int,
LastChangeDate: datetime,
NextChangeDate: datetime,
IsChanging: bool,
ChangeState: int,
MappedAccounts :
        AliasID: int,

        ManagedAccountID: int,
        Status: string
    },
```

# **Response Codes**

200 - Request successful. Alias in response body.

# **Applications**

#### **Quick Navigation**

- "GET Applications" on page 167
- "GET Applications/{id}" on page 168

# **GET Applications**

# **Purpose**

Returns a list of applications.

### **Required Permissions**

Password Safe Account Management (Read).

# **Request Body**

None.

# **Response Body**

```
{
    ApplicationID : int,
    Name : string,
    DisplayName : string,
    Version : string,
    Command : string,
    Parameters : string,
    Publisher : string,
    ApplicationType : string,
    FunctionalAccountID : int, // can be null
    ManagedSystemID : int, // can be null
    IsActive : bool,
    SmartRuleID : int // can be null
}
...
```

200 - Request successful. Applications in response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Applications/{id}**

#### **Purpose**

Returns an application by ID.

### **Required Permissions**

Password Safe Account Management (Read).

#### **URL Parameters**

id: ID of the application.

#### **Request Body**

None.

# **Response Body**

```
ApplicationID : int,
Name : string,
DisplayName : string,
Version : string,
Command : string,
Parameters : string,
Publisher : string,
ApplicationType : string,
FunctionalAccountID : int, // can be null
ManagedSystemID : int, // can be null
IsActive : bool,
SmartRuleID : int // can be null
}
```

200 - Request successful. Application in response body.

#### **Attributes**

### **Quick Navigation**

- "GET ManagedAccounts/{managedAccountID}/Attributes" on page 170
- "GET ManagedSystems/{managedSystemID}/Attributes" on page 171
- "POST ManagedAccounts/{managedAccountID}/Attributes/{attributeID}" on page 172

- "DELETE ManagedSystems/{managedSystemID}/Attributes" on page 175
- "DELETE ManagedSystems/{managedSystemID}/Attributes/{attributeID}" on page 176

# **GET ManagedAccounts/{managedAccountID}/Attributes**

### **Purpose**

Returns a list of attributes by managed account ID.

# **Required Permissions**

Password Safe Account Management (Read), Attribute Management (Read).

#### **URL Parameters**

managedAccountID: ID of the managed account.

# **Request Body**

None.

# **Response Body**

```
{
    AttributeID : int,
    AttributeTypeID : int,
    ParentAttributeID : int, // can be null
    ShortName : string,
    LongName : string,
```

```
Description : string, ValueInt : int, // can be null
    IsReadOnly: bool
},
...
]
```

201 - Request successful. Attributes associated with the asset in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET ManagedSystems/{managedSystemID}/Attributes**

#### **Purpose**

Returns a list of attributes by managed system ID.

#### **Required Permissions**

Password Safe System Management (Read), Attribute Management (Read).

#### **URL Parameters**

managedSystemID: ID of the managed system.

# **Request Body**

None.

# **Response Body**

```
{
    AttributeID : int,
    AttributeTypeID : int,
    ParentAttributeID : int, // can be null
    ShortName : string,
    LongName : string,
    Description : string,
    ValueInt : int, // can be null
    IsReadOnly: bool
```

```
},
...
1
```

200 - Request successful. Attributes associated with the Managed System in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST ManagedAccounts/{managedAccountID}/Attributes/{attributeID}

### **Purpose**

Assigns an attribute to a managed account.

#### **Required Permissions**

Password Safe Account Management (Read/Write), Attribute Management (Read/Write).

#### **URL Parameters**

- · managedAccountID: ID of the managed account.
- attributeID: ID of the attribute.

# **Request Body**

None.

# **Response Body**

```
{
    AttributeID : int,
    AttributeTypeID : int,
    ParentAttributeID : int, // can be null
    ShortName : string,
    LongName : string,
    Description : string, ValueInt : int, // can be null
    IsReadOnly: bool
},
```

... ]

# **Response Codes**

201 - Request successful. Attribute in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST ManagedSystems/{managedSystemID}/Attributes/{attributeID}

#### **Purpose**

Assigns an attribute to a managed system.

### **Required Permissions**

Password Safe System Management (Read/Write), Attribute Management (Read/Write).

#### **URL Parameters**

 $\label{eq:managedSystemID: ID of the managed system.}$ 

attributeID: ID of the attribute.

# **Request Body**

None.

# **Response Body**

```
AttributeID : int,
AttributeTypeID : int,
ParentAttributeID : int, // can be null
ShortName : string,
LongName : string,
Description : string,
ValueInt : int, // can be null
IsReadOnly: bool
},
```

. ]

# **Response Codes**

201 - Request successful. Attribute in the response body.

For more information, please see "Common Response Codes" on page 16.

# DELETE ManagedAccounts/{managedAccountID}/Attributes

#### **Purpose**

Deletes all managed account attributes by managed account ID.

# **Required Permissions**

Password Safe Account Management (Read/Write), Attribute Management (Read/Write).

#### **URL Parameters**

managedAccountID: ID of the managed account.

### **Request Body**

None.

# **Response Body**

None.

# **Response Codes**

200 - Request successful.

# DELETE ManagedAccounts/{managedAccountID}/Attributes/ {attributeID}

### **Purpose**

Deletes a managed account attribute by managed account ID and attribute ID.

### **Required Permissions**

Password Safe Account Management (Read/Write), Attribute Management (Read/Write).

#### **URL Parameters**

- managedAccountID: ID of the managed account.
- attributeID: ID of the attribute.

#### **Request Body**

None.

# **Response Body**

None.

# **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **DELETE ManagedSystems/{managedSystemID}/Attributes**

### **Purpose**

Deletes all managed system attributes by managed system ID.

# **Required Permissions**

Password Safe System Management (Read/Write), Attribute Management (Read/Write).

TC: 11/7/2023

Ul	RΙ	2	ara	an	ne	te	rs

managedSystemID: ID of the managed system.

### **Request Body**

None.

### **Response Body**

None.

#### **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# DELETE ManagedSystems/{managedSystemID}/Attributes/{attributeID}

#### **Purpose**

Deletes a managed system attribute by managed system ID and attribute ID.

# **Required Permissions**

Password Safe System Management (Read/Write), Attribute Management (Read/Write).

#### **URL Parameters**

managedSystemID: ID of the managed system.

attributeID: ID of the attribute.

### **Request Body**

None.

# **Response Body**

None.

200 - Request successful.

### **Credentials**

#### **Quick Navigation**

- "GET Credentials/{requestId}" on page 178
- "GET Aliases/{aliasId}/Credentials/{requestId}" on page 179

For more information on related topics, please see:

- "Requests" on page 375
- "Aliases" on page 162
- "Managed Accounts" on page 224

# **GET Credentials/{requestId}**

#### **Purpose**

Retrieves the credentials for an approved and active (not expired) credentials release request.

# **Required Permissions**

None.

#### **URL Parameters**

requestId: ID of the request for which to retrieve the credentials.

# **Query Parameters**

- type: (optional, default: password) Type of credentials to retrieve.
  - o password: Returns the password in the response body.
  - o dsskey: Returns the DSS private key in the response body.

Note: The key is returned in the state in which it was set. For example, an encrypted key is returned encrypted.

o passphrase: Returns the DSS key passphrase in the response body.

Note: passphrase supported only for encrypted DSS keys.

### **Request Body**

None.

### **Response Body**

Credentials: string

#### Response Codes

- 200 Request successful. Credentials in the response body.
- 403 User does not have permissions to request credentials for the indicated account or the account does not have API access enabled.
  - 4031 User does not have permission to request credentials. 4034 Request is not yet approved.
- 404 Could not find the request to release. The specified request ID may have already been released or has expired.

For more information, please see "Common Response Codes" on page 16.

# **GET Aliases/{aliasId}/Credentials/{requestId}**

### **Purpose**

Retrieves the credentials and alias details for an approved and active (not expired) credentials release request for an alias.

# **Required Permissions**

None.

#### **URL Parameters**

- · aliasId: ID of the alias.
- requestId: ID of the request for which to retrieve the credentials.

# **Query Parameters**

- type: (optional, default: password) Type of credentials to retrieve.
- password: Returns the password in response body property Password.
- dsskey: Returns the DSS private key in response body property PrivateKey.

TC: 11/7/2023

Note: The key is returned in the state in which it was set. For example, an encrypted key is returned encrypted.

• passphrase: returns the DSS key passphrase in response body property Passphrase.

Note: passphrase supported only for encrypted DSS keys.

# **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
AliasID: int,
AliasName: string,
SystemID: int,
SystemName: string,
AccountID: int,
AccountName: string,
DomainName: string,
Password: string,
PrivateKey: string,
Passphrase: string
}
```

# **Response Codes**

- 200 Request successful. Account details and credentials in the response body.
- 403 User does not have permissions to request credentials for the indicated alias or the account referenced by the alias does not
  have API access enabled.
  - 4031 User does not have permission to request credentials.
  - o 4034 Request is not yet approved.
- 404 Could not find the request to release. The specified request ID may have already been released or has expired.

## **Custom Platforms**

Administrators have the ability to to export the custom platform configuration data from a customer's on-premises Password Safe instance and import the configuration data into a Password Safe Cloud instance.

## **Quick Navigation**

- "GET CustomPlatforms" on page 181
- "GET CustomPlatforms/{id}" on page 182
- "POST CustomPlatforms/Import" on page 183
- "POST CustomPlatforms/{id}/Export" on page 184

#### **GET CustomPlatforms**

## **Purpose**

Returns a list of platforms for managed systems.

# **Required Permissions**

Password Safe Configuration Management (Read).

# **Request Body**

None.

# **Response Body**

Content-Type: application/json

# **Response Body Details**

- PlatformID: Platform ID.
- Name: Platform Name.

## **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **GET CustomPlatforms/{id}**

## **Purpose**

Returns a custom platform by ID.

## **Required Permissions**

Password Safe Configuration Management (Read).

#### **URL Parameters**

id: ID of the platform.

## **Request Body**

None.

# **Response Body**

Content-Type: application/json

# **Response Body Details**

- PlatformID: Platform ID.
- Name: Platform Name.

## **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **POST CustomPlatforms/Import**

## **Purpose**

Imports a custom platform.

## **Required Permissions**

Password Safe Configuration Management (Read/Write).

#### **URL Parameters**

None.

## **Request Body**

```
{
   CustomPlatform : string
}
```

# **Response Body**

```
[
    {
    PlatformId : int,
    },
    ...
]
```

## **Response Body Details**

• PlatformId: The ID of the custom platform.

## **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# POST CustomPlatforms/{id}/Export

#### **Purpose**

Exports a particular custom platform.

## **Required Permissions**

Password Safe Configuration Management (Read).

#### **URL Parameters**

id: ID of the custom platform.

## **Request Body**

None.

# **Response Body**

Content-Type: application/xml

# **Response Body Details**

The custom platform XML data is returned in the response..

# **Response Codes**

200 - Request successful.

## **Directories**

## **Quick Navigation**

- "GET Directories" on page 185
- "GET Directories/{id}" on page 186
- "POST Workgroups/{id}/Directories" on page 187
- "PUT Directories/{id}" on page 190
- "DELETE Directories" on page 192

For more information on related topics, please see "Managed Systems" on page 283.

#### **GET Directories**

#### **Purpose**

Returns a list of directories.

# **Required Permissions**

One of: Password Safe System Management (Read), Password Safe Domain Management (Read).

# **Request Body**

None.

## **Response Body**

```
MaxReleaseDuration : int,
    ISAReleaseDuration : int,
    AccountNameFormat : int,
    AutoManagementFlag : bool,
    FunctionalAccountID : int, // can be null
    CheckPasswordFlag : bool,
    ChangePasswordAfterAnyReleaseFlag : bool,
    ResetPasswordOnMismatchFlag : bool,
    ChangeFrequencyType : string,
    ChangeFrequencyDays : int,
}
```

## **Response Codes**

200 - Request successful. Directory in response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Directories/{id}**

#### **Purpose**

Returns a directory by ID.

# **Required Permissions**

One of: Password Safe System Management (Read), Password Safe Domain Management (Read).

#### **URL Parameters**

id: ID of the directory.

# **Request Body**

None.

# **Response Body**

```
{
    DirectoryID : int,
    WorkgroupID : int,
```

```
PlatformID : int,
DomainName : string,
ForestName : string,
NetBiosName : string,
UseSSL : bool,
Port : int, // can be null
Timeout : short,
Description : string,
ContactEmail : string,
PasswordRuleID : int,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
AccountNameFormat : int,
AutoManagementFlag: bool,
FunctionalAccountID : int, // can be null
CheckPasswordFlag : bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ResetPasswordOnMismatchFlag : bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
```

# POST Workgroups/{id}/Directories

## **Purpose**

Creates a new directory in the Workgroup referenced by ID.

# **Required Permissions**

One of: Password Safe System Management (Read/Write), Password Safe Domain Management (Read/Write).

#### **URL Parameters**

id: ID of the Workgroup.

# **Request Body**

```
PlatformID : int,
DomainName : string,
ForestName : string,
NetBiosName : string,
UseSSL : bool,
```

```
Port : int, // can be null
Timeout : short,
Description : string,
ContactEmail : string,
PasswordRuleID : int,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
AccountNameFormat : int,
AutoManagementFlag : bool,
FunctionalAccountID : int, // can be null
CheckPasswordFlag : bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ResetPasswordOnMismatchFlag: bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
```

#### **Request Body Details**

- PlatformID: (required) ID of the platform
- DomainName: (required) Name of the domain. Max string length is 128.
- ForestName: (required for Active Directory only, not applicable to LDAP) Name of the directory forest. Max string length is 64.
- NetBiosName: (required for Active Directory, optional for LDAP) NetBIOS name of the directory. Max string length is 15.
- UseSSL: (default: false) True to use an SSL connection, otherwise false.
- **Port:** (set automatically for Active Directory, optional for LDAP) The port used to connect to the host. If null and the related Platform is LDAP, Password Safe uses **Platform.DefaultPort**.
- **Timeout:** (seconds, default: 30) Connection timeout. Length of time in seconds before a slow or unresponsive connection to the system fails.
- Description: (optional) Description of the directory. Max string length is 255.
- ContactEmail: Max string length is 1000.
- PasswordRuleID: (default: 0) ID of the default password rule assigned to managed accounts created under this managed system.
- ReleaseDuration: (minutes: 1-525600, default: 120) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600, default: 525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600, default: 120) Default Information Systems Administrator (ISA) release duration.
- AccountNameFormat: (Active Directory only, default: 0) Account Name format to use:
  - 0: Domain and Account. Use ManagedAccount.DomainName\ManagedAccount.AccountName
  - o 1: UPN. Use the Managed Account UPN
  - o 2: SAM. Use the Managed Account SAM Account Name
- AutoManagementFlag: (default: false) True if password auto-management is enabled, otherwise false. Can be set if Platform.AutoManagementFlag is true.
  - FunctionalAccountID: (required if AutoManagementFlag is true) ID of the functional account used for managed account
    password changes. FunctionalAccount.PlatformID must match the PlatformID.

- CheckPasswordFlag: True to enable password testing, otherwise false.
- ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
- ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
- ChangeFrequencyType: (default: first) The change frequency for scheduled password changes:
  - first: Changes scheduled for the first day of the month
  - last: Changes scheduled for the last day of the month
  - xdays: Changes scheduled every x days (see ChangeFrequencyDays)
- ChangeFrequencyDays: (days: 1-999, required if ChangeFrequencyType is xdays) When ChangeFrequencyType is xdays, password changes take place this configured number of days.
- o ChangeTime: (24hr format: 00:00-23:59, default: 23:30) UTC time of day scheduled password changes take place.

#### **Response Body**

Content-Type: application/json

```
DirectoryID : int,
WorkgroupID : int,
PlatformID : int,
DomainName : string,
ForestName : string,
NetBiosName : string,
UseSSL : bool,
Port : int, // can be null
Timeout : short,
Description : string,
ContactEmail: string,
PasswordRuleID : int,
ReleaseDuration : int,
MaxReleaseDuration: int,
ISAReleaseDuration : int,
AccountNameFormat : int,
AutoManagementFlag: bool,
FunctionalAccountID : int, // can be null
CheckPasswordFlag : bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ResetPasswordOnMismatchFlag: bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
```

# Response Codes

201 - Request successful. Directory in response body.

# **PUT Directories/{id}**

#### **Purpose**

Updates an existing directory by ID.

### **Required Permissions**

One of: Password Safe System Management (Read/Write), Password Safe Domain Management (Read/Write).

#### **URL Parameters**

id: ID of the directory.

### **Request Body**

Content-Type: application/json

```
PlatformID : int,
WorkgroupID : int,
DomainName : string,
ForestName : string,
NetBiosName : string,
UseSSL : bool,

## **Response Codes**

200 - Request successful. Directory in response body.

For more information, please see "Common Response Codes" on page 16.

#### **DELETE Directories**

# **Purpose**

Deletes a directory by ID.

# **Required Permissions**

One of: Password Safe System Management (Read/Write), Password Safe Domain Management (Read/Write).

#### **URL Parameters**

id: ID of the directory.

# **Request Body**

None.

# **Response Body**

None.

## **Response Codes**

200 - Request successful.

## **Oracle Internet Directories**

## **Quick Navigation**

- "GET OracleInternetDirectories" on page 194
- "GET OracleInternetDirectories/{id}" on page 195
- "GET Organizations/{id}/OracleInternetDirectories" on page 195
- "POST OracleInternetDirectories/{id}/Services/Query" on page 196
- "POST OracleInternetDirectories/{id}/Test" on page 197

#### **GET OracleInternetDirectories**

## **Purpose**

Returns a list of Oracle Internet Directories.

## **Required Permissions**

Password Safe System Management (Read).

# **Request Body**

None.

# **Response Body**

Content-type: application/json

```
[{
    OrganizationID : Guid,
    OracleInternetDirectoryID : Guid,
    Name : string,
    Description : string,
},
...]
```

# **Response Codes**

200 - Request successful. Oracle Internet Directories in response body.

# **GET OracleInternetDirectories/{id}**

#### **Purpose**

Returns an Oracle Internet Directory by ID.

### **Required Permissions**

Password Safe System Management (Read).

#### **URL Parameters**

id: ID of the Oracle Internet Directory.

### **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
{
   OrganizationID : Guid,
   OracleInternetDirectoryID : Guid,
   Name : string,
   Description : string,
}
```

# **Response Codes**

200 - Request successful. Oracle Internet Directory in response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Organizations/{id}/OracleInternetDirectories**

## **Purpose**

Returns a list of Oracle Internet Directories by organization ID.

## **Required Permissions**

Password Safe System Management (Read).

#### **URL Parameters**

id: ID of the organization.

## **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
[{
    OrganizationID : Guid,
    OracleInternetDirectoryID : Guid,
    Name : string,
    Description : string,
},
...]
```

# **Response Codes**

200 - Request successful. Oracle Internet Directories in response body.

For more information, please see "Common Response Codes" on page 16.

# POST OracleInternetDirectories/{id}/Services/Query

# **Purpose**

Queries and returns DB Services for an Oracle Internet Directory by ID.

# **Required Permissions**

Password Safe System Management (Read/Write).

#### **URL Parameters**

id: ID of the Oracle Internet Directory.

# **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
Success : bool,
Message : string,
Services : [{
  Name : string,
},
...]
}
```

## **Response Codes**

200 - Request successful. Oracle Internet Directory query result in response body.

For more information, please see "Common Response Codes" on page 16.

# POST OracleInternetDirectories/{id}/Test

## **Purpose**

Tests the connection to an Oracle Internet Directory by ID.

# **Required Permissions**

Password Safe System Management (Read/Write).

#### **URL Parameters**

id: ID of the Oracle Internet Directory.

# **Request Body**

None.

# Response Body

```
{
   Success: bool,
}
```

# **Response Codes**

200 – Request successful. Oracle Internet Directory test result in response body.

# **DSS Key Policies**

**Note:** DSS Key Policies are formerly known as DSS Key Rules but the API remains **DSSKeyRules** to be compatible with earlier versions.

## **Quick Navigation**

- "GET DSSKeyRules" on page 199
- "GET DSSKeyRules/{id}" on page 200

# **GET DSSKeyRules**

## **Purpose**

Returns a list of DSS Key Rules.

## **Required Permissions**

Password Safe System Management (Read).

# **Request Body**

None.

# **Response Body**

```
[
    DSSKeyRuleID: int,
    Name: string,
    Description: string,
    KeyType: string,
    KeySize: int,
    EncryptionType: char,
    PasswordRuleID: int, // can be null
},
...
]
```

## **Response Body Details**

- KeyType: (RSA, DSA) The type of key to generate.
- EncryptionType: The type of key encryption to use:
  - A: Auto-managed passphrase, generated using the associated password rule (see PasswordRuleID).
  - N: No encryption.
- PasswordRuleID: (given when EncryptionType is A) ID of the password rule used to auto-generate the passphrase for DSS key encryption.

## **Response Codes**

200 - Request successful. DSS Key Rules in the response body.

For more information, please see "Common Response Codes" on page 16.

# GET DSSKeyRules/{id}

### **Purpose**

Returns a DSS Key Rule by ID.

# **Required Permissions**

Password Safe System Management (Read).

#### **URL Parameters**

id: ID of the DSS Key Rule.

## **Request Body**

None.

# Response Body

```
DSSKeyRuleID: int,
Name: string,
Description: string,
KeyType: string,
```

```
KeySize: int,
EncryptionType: char,
PasswordRuleID: int, // can be null
}
```

## **Response Body Details**

- **KeyType:** The type of key to generate (RSA, DSA).
- EncryptionType: The type of key encryption to use:
  - · A: Auto-managed passphrase, generated using the associated password rule (see PasswordRuleID).
  - N: No encryption.
- PasswordRuleID: (given when EncryptionType is A) ID of the password rule used to auto-generate the passphrase for DSS key encryption.

## **Response Codes**

200 - Request successful. DSS Key Rule in the response body.

# **Entity Types**

Entity types define the types of entities within Password Safe (for example, asset, database, directory, and cloud).

For more information on related topics, please see "Platforms" on page 351.

# **GET EntityTypes**

## **Purpose**

Returns a list of entity types.

## **Required Permissions**

None.

## **Request Body**

None.

## **Response Body**

Content-Type: application/json

# **Response Codes**

200 - Request successful. Entity types in the response body.

## **Functional Accounts**

#### **Quick Navigation**

- "GET FunctionalAccounts" on page 203
- "GET Functional Accounts/{id}" on page 204
- "POST FunctionalAccounts" on page 205
- "DELETE FunctionalAccounts/{id}" on page 207

#### **GET FunctionalAccounts**

### **Purpose**

Returns a list of functional accounts.

## **Required Permissions**

Password Safe Account Management (Read).

## **Request Body**

None.

# **Response Body**

```
{
    FunctionalAccountID : int,
    PlatformID : int,
    DomainName : string,
    AccountName : string,
    DisplayName : string,
    Description : string,
    ElevationCommand : string,
    SystemReferenceCount : int,
    TenantID : string,
    ObjectID : string
},
...
```

## **Response Body Details**

- · PlatformID: ID of the platform to which the account belongs.
- DomainName: Domain name of the account.
- AccountName: Name of the account (does not include domain name).
- . DisplayName: The display name or alias for the account.
- Description: Description of the account.
- ElevationCommand: Elevation command used for SSH connections (sudo, pbrun, pmrun).
- · SystemReferenceCount: The count of managed systems that reference the functional account.
- · TenantID: TenantID of the account (if applicable).
- ObjectID: ObjectID of the account (if applicable).

### **Response Codes**

200 - Request successful. Functional account in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET FunctionalAccounts/{id}**

## **Purpose**

Returns a functional account by ID.

# **Required Permissions**

Password Safe Account Management (Read).

#### **URL Parameters**

id: ID of the functional account.

# **Request Body**

None.

# **Response Body**

```
FunctionalAccountID : int,
PlatformID: int, DomainName : string,
AccountName : string,
DisplayName : string,
Description : string,
ElevationCommand : string,
SystemReferenceCount : int,
TenantID : string,
ObjectID : string
}
```

## **Response Body Details**

- PlatformID: ID of the platform to which the account belongs.
- DomainName: Domain name of the account.
- · AccountName: Name of the account (does not include domain name).
- . DisplayName: The display name or alias for the account.
- · Description: Description of the account.
- ElevationCommand: Elevation command used for SSH connections (sudo, pbrun, pmrun).
- · SystemReferenceCount: The count of managed systems that reference the functional account.
- TenantID: TenantID of the account (if applicable).
- ObjectID: ObjectID of the account (if applicable).

## **Response Codes**

200 - Request successful. Functional Account in the response body.

For more information, please see "Common Response Codes" on page 16.

## **POST FunctionalAccounts**

# **Purpose**

Creates a functional account.

# **Required Permissions**

Password Safe Account Management (Read/Write).

# **Request Body**

```
PlatformID : int,
  DomainName : string,
  AccountName : string,
  DisplayName : string,
  Password : string,
  PrivateKey : string,
  Passphrase : string,
  Description : string,
  ElevationCommand : string,
  TenantID : string,
  ObjectID : string,
  Secret : string
}
```

#### **Request Body Details**

- PlatformID: (required) ID of the platform to which the account belongs.
- DomainName: (optional) Domain name of the account. Can be set if Platform.DomainNameFlag is true. Max string length is 50.
- AccountName: (required) Name of the account (do not include domain name). Max string length is 245.
- **DisplayName:** (optional) The display name or alias for the account. If not given, uses the **AccountName**. Must be unique for the platform. Max string length is 100.
- Password: (required when Platform.RequiresSecret is false) The current account password.
- PrivateKey: (optional) DSS private key. Can be set if Platform.DSSFlag is true.
- Passphrase: (required when PrivateKey is an encrypted DSS key) DSS passphrase. Can be set if Platform.DSSFlag is true.
- Description: (optional) Description of the account. Max string length is 1000.
- ElevationCommand: (optional) Elevation command to use for SSH connections. Can be set if **Platform.SupportsElevationFlag** is true (**sudo**, **pbrun**, **pmrun**). Max string length is 80.
- TenantID: string (required when Platform.RequiresTenantID is true). Max string length is 36.
- ObjectID: string (required when Platform.RequiresObjectID is true). Max string length is 36.
- Secret: string: (required when Platform.RequiresSecret is true). Max string length is 255.

## **Response Body**

```
FunctionalAccountID : int,
PlatformID : int,
DomainName : string,
AccountName : string,
DisplayName : string,
Description : string,
ElevationCommand : string,
SystemReferenceCount : int,
TenantID : string,
```

ObjectID : string

## **Response Body Details**

- PlatformID: ID of the platform to which the account belongs.
- DomainName: Domain name of the account.
- AccountName: Name of the account (does not include domain name).
- DisplayName: The display name or alias for the account.
- · Description: Description of the account.
- ElevationCommand: Elevation command used for SSH connections (sudo, pbrun, pmrun).
- SystemReferenceCount: The count of managed systems that reference the functional account.
- TenantID: TenantID of the account (if applicable).
- · ObjectID: ObjectID of the account (if applicable).

## **Response Codes**

201 - Request successful. Functional Account in the response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE FunctionalAccounts/{id}**

## **Purpose**

Deletes a functional account by ID.

# **Required Permissions**

Password Safe Account Management (Read/Write).

# **Other Requirements**

The functional account cannot be referenced by any managed systems.

#### **URL Parameters**

id: ID of the functional account.

# **Request Body**

None.

# **Response Body**

None.

## **Response Codes**

200 - Request successful.

# **ISA Requests**

The ISAR equests endpoint is for Information Systems Administrator (ISA) role access.

For more information on Requestor and Requestor/Approver role access, please see "POST Requests" on page 376.

## **POST ISARequests**

#### **Purpose**

Creates a new Information Systems Administrator (ISA) release request and returns the requested credentials.

Similar to POST Requests (AccessType=View) and GET Credentials in a single call.

## **Required Roles**

ISA Role to managed account referenced by ID.

### **Query Parameters**

- type: (optional, default: password) Type of credentials to retrieve.
  - o password: Returns the password in the response body.
  - o dsskey: Returns the DSS private key in the response body.

Note: The key is returned in the state in which it was set. For example, an encrypted key is returned encrypted.

o passphrase: Returns the DSS key passphrase in the response body.

Note: passphrase supported only for encrypted DSS keys.

# **Request Body**

```
SystemID: int,
AccountID: int,
DurationMinutes: int, // can be null
Reason: string
}
```

## **Request Body Details**

- SystemID: (required) ID of the managed system to request.
- AccountID: (required) ID of the managed account to request.
- **DurationMinutes:** (optional) The request duration (in minutes). If omitted, uses the value **ManagedAccount.ISAReleaseDuration**.
- Reason: (optional) The reason for the request.

## **Response Body**

```
{
   Credentials: string
}
```

## **Response Codes**

201 - Request successful. Credentials in the response body.

## **ISA Sessions**

The ISASessions endpoint is for Information Systems Administrator (ISA) role access.

For more information on Requestor and Requestor/Approver role access, please see the following:

- "POST Requests" on page 376
- "POST Requests/{requestID}/Sessions" on page 398

## **POST ISASessions**

#### **Purpose**

Creates a new Information Systems Administrator (ISA) release request and returns the requested session.

Similar to POST Requests and POST Sessions in a single call.

### **Required Roles**

ISA role to managed account referenced by ID.

## **Request Body**

Content-Type: application/json

```
SessionType : string,
SystemID: int,
AccountID: int,
DurationMinutes : int, // can be null
ApplicationID: int, // can be null
Reason : string
}
```

# **Request Body Details**

- **SessionType:** (required) The type of session to create.
- SystemID: (required) ID of the managed system to request.
- AccountID: (required) ID of the managed account to request.
- **DurationMinutes:** (optional) The request duration (in minutes). If omitted, uses the value **ManagedAccount.ISAReleaseDuration**.
- ApplicationID: (required when AccessType = App or AccessType = AppFile) ID of the application to request.
- Reason: (optional) The reason for the request.

## Response Body (SSH or sshticket)

Content-Type: application/json

```
ID : string,
  Ticket : string,
  Host : string,
  Port : string,
  TicketAtHost : string,
  Link : string,
  Command : string
}
```

## Response Body (RDP or rdpticket)

Content-Type: application/json

```
ID : string,
Ticket : string,
Host : string,
Port : string
}
```

## Response Body (rdpfile or appfile)

RDP file as an attachment.

# **Response Codes**

201- Request successful. Session details or RDP file in the response body.

# **Keystrokes**

## **Quick Navigation**

- "GET Sessions/{sessionId:int}/Keystrokes" on page 213
- "GET Keystrokes/{id:long}" on page 214
- "POST Keystrokes/Search" on page 214

# **GET Sessions/{sessionId:int}/Keystrokes**

#### **Purpose**

Returns a list of keystrokes by session ID.

## **Required Roles**

Password Safe Auditor role, ISA role, or a member of BeyondInsight Administrators group.

#### **URL Parameters**

sessionId: ID of recorded RDP/SSH session.

## **Response Body**

Content-Type: application/json

# **Response Codes**

200 - Request successful. Keystrokes are in response body.

# **GET Keystrokes/{id:long}**

#### **Purpose**

Returns a keystroke by ID.

### **Required Roles**

Password Safe Auditor role, ISA role, or a member of BeyondInsight Administrators group.

#### **URL Parameters**

id: ID of a keystroke.

### **Response Body**

Content-Type: application/json

```
{
   KeystrokeID: long,
   SessionID: int,
   TimeMarker: long,
   Type: byte ,
   Data: string
}
```

# **Response Codes**

200 - Request successful. Keystroke in response body.

For more information, please see "Common Response Codes" on page 16.

# **POST Keystrokes/Search**

# **Purpose**

Search for keystrokes.

# **Required Roles**

Password Safe Auditor role, ISA role, or a member of BeyondInsight Administrators group.

## **Request Body**

Content-Type: application/json

```
{
   Data: string,
   Type: byte
}
```

### **Request Body Details**

- Data: (required) Keyword(s) for which to search.
- Type: (default: 0) Type of keystrokes:
  - ∘ **0:** All
  - o 1: StdIn
  - o 2: StdOut
  - 4: Window Event
  - o 5: User Event

## **Response Body**

Content-Type: application/json

# **Response Codes**

200 - Request successful. Keystrokes are in response body.

## **Linked Accounts**

Linked accounts are Directory managed accounts that are linked to asset-based managed systems.

Note: Directory accounts can be linked only to managed assets and managed databases.

## **Quick Navigation**

- "GET ManagedSystems/{systemID}/LinkedAccounts" on page 216
- "POST ManagedSystems/{systemID}/LinkedAccounts/{accountID}" on page 219
- "DELETE ManagedSystems/{systemID}/LinkedAccounts" on page 221
- "DELETE ManagedSystems/{systemID}/LinkedAccounts/{accountID}" on page 222

# **GET ManagedSystems/{systemID}/LinkedAccounts**

#### **Purpose**

Returns a list of linked directory managed accounts by managed system ID.

# **Required Permissions**

Password Safe System Management (Read).

#### **URL Parameters**

systemID: ID of the managed system.

## **Request Body**

None.

# **Response Body**

```
PasswordFallbackFlag : bool,
LoginAccountFlag : bool,
Description : string,
PasswordRuleID : int,
ApiEnabled : bool,
ReleaseNotificationEmail: string,
ChangeServicesFlag: bool,
RestartServicesFlag : bool,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
MaxConcurrentRequests : int,
AutoManagementFlag: bool,
DSSAutoManagementFlag: bool,
CheckPasswordFlag : bool,
ResetPasswordOnMismatchFlag: bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
ParentAccountID : int, // can be null
IsSubscribedAccount : bool,
LastChangeDate : datetime, // can be null
NextChangeDate : datetime, // can be null
IsChanging : bool,
ChangeState : int,
UseOwnCredentials : bool,
ChangeIISAppPoolFlag : bool,

WorkgroupID : int, // can be null
ChangeWindowsAutoLogonFlag : bool,
ChangeComPlusFlag : bool,
ChangeDComFlag: bool,
ChangeSComFlag: bool,
},
```

## **Response Body Details**

- DomainName: The domain name for a domain-type account.
- · AccountName: The name of the account.
- DistinguishedName: The distinguished name of an LDAP managed account.
- PasswordFallbackFlag: True if failed DSS authentication can fall back to password authentication, otherwise false.
- LoginAccountFlag: True if the account should use the managed system login account for SSH sessions, otherwise false.
- Description: A description of the account.
- PasswordRuleID: ID of the password rule assigned to this managed account.
- ApiEnabled: True if the account can be requested through the API, otherwise false.

TC: 11/7/2023

- ReleaseNotificationEmail: Email address used for notification emails related to this managed account.
- ChangeServicesFlag: True if services run as this user should be updated with the new password after a password change, otherwise false.
- RestartServicesFlag: True if services should be restarted after the run as password is changed (see ChangeServicesFlag),
  otherwise false.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- MaxConcurrentRequests: (0-999, 0 means unlimited) Maximum number of concurrent password requests for this account.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - DSSAutoManagementFlag: True if DSS key auto-management is enabled, otherwise false.
  - o CheckPasswordFlag: True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - **ChangeFrequencyType:** The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (see ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-999) When ChangeFrequencyType is xdays, password changes take place this
    configured number of days.
  - o ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- · ParentAccountID: If this is a subscribed account (see IsSubscribedAccount), this is the ID of the parent managed account.
- IsSubscribedAccount: True if the account is a synced or subscribed account, otherwise false.
- LastChangeDate: The date and time of the last password change.
- NextChangeDate: The date and time of the next scheduled password change.
- IsChanging: True if the account credentials are in the process of changing, otherwise false.
- ChangeState: The change state of the account credentials:
  - **0:** Idle / no change taking place or scheduled within 5 minutes.
  - 1: Changing / managed account credential currently changing.
  - 2: Queued / managed account credential is queued to change or scheduled to change within 5 minutes.

For more information, please see <u>Configure Subscriber Accounts</u> at <u>https://www.beyondtrust.com/docs/beyondinsight-password-safe/ps/admin/managed-accounts.htm</u>#ConfigureAccounts.

## Response Codes

200 - Request successful. Linked managed account in the response body.

For more information, please see "Common Response Codes" on page 16.

## POST ManagedSystems/{systemID}/LinkedAccounts/{accountID}

#### **Purpose**

Links a directory managed account to the managed system referenced by ID.

#### **Required Permissions**

Password Safe System Management (Read/Write).

#### **URL Parameters**

- · systemID: ID of the managed system.
- · accountID: ID of the directory managed account.

#### Request Body

None.

## **Response Body**

  - 2: Queued / managed account credential is queued to change or scheduled to change within 5 minutes.

For more information, please see <u>Configure Subscriber Accounts</u> at <u>https://www.beyondtrust.com/docs/beyondinsight-password-safe/ps/admin/managed-accounts.htm#ConfigureAccounts</u>.

## Response Codes

- 200 Account was already linked. Directory Managed Account in the response body.
- 201 Account was linked successfully. Directory Managed Account in the response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE ManagedSystems/{systemID}/LinkedAccounts**

## **Purpose**

Unlinks all directory managed accounts from the managed system by ID.

## **Required Permissions**

Password Safe System Management (Read/Write).

TC: 11/7/2023

11							4	
u	ĸ	۲	a	га	ш	e	lе	ГS

systemID: ID of the managed system.

### **Request Body**

None.

## **Response Body**

None.

#### **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **DELETE ManagedSystems/{systemID}/LinkedAccounts/{accountID}**

#### **Purpose**

Unlinks a directory managed account from the managed system by ID.

## **Required Permissions**

Password Safe System Management (Read/Write).

#### **URL Parameters**

- · systemID: ID of the managed system.
- · accountID: ID of the directory managed account.

## **Request Body**

None.

## **Response Body**

None.

# **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

## Managed Accounts

There are two different ways to interact with managed accounts:

- 1. Role-based:Requestor, Requestor/Approver, or ISA role assigned for requesting access to a specific managed account.
- 2. **Permission-based**: A user with appropriate **Password Safe Account Management** permission for provisioning accounts and viewing the definition of a managed account.

#### **Role-based Access**

#### **Quick Navigation**

- "GET ManagedAccounts" on page 224
- "GET ManagedAccounts?systemName={systemName}&accountName={accountName}" on page 228
- i For m

For more information on related topics, please see:

- "Managed Systems" on page 283
- "Requests" on page 375
- "Quick Rules" on page 363
- "Smart Rules" on page 106

## **GET ManagedAccounts**

**Note:** When specifying a directory managed account name in the **GET ManagedAccounts** API call, the account name must be in the UPN or Domain\AccountName format, even if the option **type=domainlinked** is specified.

For example:

GET managedaccounts?accountname=domain\directoryAccount&type=domainlinked

type=domainlinked is not necessary in the example above.

**type=domainlinked** can be used to limit the returned results to domain accounts when an account name is not included in the call. **type=domainlinked** can also be useful when you want to exclude local accounts when specifying the systemname.

If a managed account name is not specified, then **type=domainlinked** can be used to get all the domain linked accounts that the logged-in user has access to.

## **Purpose**

Returns a list of managed accounts (or a single managed account depending on the query parameters provided) that can be requested by the current user.

TC: 11/7/2023

## **Required Roles**

Requestor, Requestor/Approver, or ISA role.

### **Other Requirements**

Only managed accounts with the Enable for API Access setting enabled are returned.

#### **Query Parameters**

- systemName: (optional) Name of the managed system.
- accountName: (optional) Name of the managed account.
- systemID: (optional) ID of the Managed System.
- workgroupName: (optional) Name of the Workgroup.
- applicationDisplayName: (optional, when given, type must be application) Display name of the application.
- ipAddress: (optional, when given type must be one of system, domainlinked, or database) IP Address of the managed asset.
- type: (optional/recommended) Type of the managed account to return.
  - o system: Returns local accounts.
  - recent: Returns recently used accounts.
  - o domainlinked: Returns domain accounts linked to systems.
  - o database: Returns database accounts.
  - o cloud: Returns cloud system accounts.
  - o application: Returns application accounts
- limit: (optional) (default: 1000) Number of records to return
- offset: (optional) (default: 0) Number of records to skip before returning limit> records

## **Request Body**

None

  LastChangeDate : datetime,
  NextChangeDate : datetime,
  IsChanging : bool,
  ChangeState : int,
  IsISAAccess : bool,
  PreferredNodeID : string
}
```

## Response Body (all other combinations of query parameters)

Content-Type: application/json

```
PlatformID : int,
SystemId : int,
SystemName : string,
DomainName : string,
AccountId : int,
AccountName : string,
InstanceName : string,
UserPrincipalName : string,
ApplicationID : int,
ApplicationDisplayName: string,
DefaultReleaseDuration : int,
MaximumReleaseDuration : int,
LastChangeDate : datetime,
NextChangeDate : datetime,
IsChanging : bool,
ChangeState : int,
IsISAAccess : bool,
PreferredNodeID: string
```

## **Response Body Details**

- PlatformID: ID of the managed system platform.
- · SystemId: ID of the managed system.
- SystemName: Name of the managed system.
- DomainName: The domain name for a domain-type account.
- · AccountId: ID of the managed account.
- AccountName: Name of the managed account.

- InstanceName: Database instance name of a database-type managed system, or empty for the default instance.
- UserPrincipalName: User Principal Name of the managed account.
- ApplicationID: ID of the application for application-based access.
- ApplicationDisplayName: Display name of the application for application-based access.
- DefaultReleaseDuration (minutes): Default release duration.
- MaximumReleaseDuration (minutes): Maximum release duration.
- LastChangeDate: The date and time of the last password change.
- NextChangeDate: The date and time of the next password change.
- IsChanging: True if the account credentials are in the process of changing, otherwise false.
- IsISAAccess: True if the account is for Information Systems Administrator (ISA) access, otherwise false.

Note: If true, credential access is through POST ISARequests and session access is through POST ISASessions.

If false, credential access is through POST Requests and GET Credentials; session access is through POST Requests and POST Sessions.

- ChangeState: The change state of the account credentials:
  - o 1: Idle / no change taking place or scheduled within 5 minutes.
  - 1: Changing / managed account credential currently changing.
  - 2: Queued / managed account credential is queued to change or scheduled to change within 5 minutes.
- PreferredNodeID: ID of the node that is preferred for establishing sessions. If no node is preferred, returns the local node ID.

For more information, please see the following:

- "ISA Requests" on page 209
- "ISA Sessions" on page 211
- "POST Requests" on page 376
- "Credentials" on page 178
- "POST Requests/{requestID}/Sessions" on page 398

## **Response Codes**

200 - Request successful. Requestable Account(s) in the response body.

For more information, please see "Common Response Codes" on page 16.

}
```

#### **Response Body Details**

- DomainName: The domain name for a domain-type account.
- · AccountName: The name of the account.
- DistinguishedName: The distinguished name of an LDAP managed account.
- PasswordFallbackFlag: True if failed DSS authentication can fall back to password authentication, otherwise false.
- UserPrincipalName: (Active Directory managed systems only) The account user principal name of an Active Directory account.
- SAMAccountName: (Active Directory managed systems only) The account SAM account name of an Active Directory account.
- LoginAccountFlag: True if the account should use the managed system login account for SSH sessions, otherwise false.
- Description: A description of the account.
- PasswordRuleID: ID of the password rule assigned to this managed account.
- ApiEnabled: True if the account can be requested through the API, otherwise false.
- · ReleaseNotificationEmail: Email address used for notification emails related to this managed account.
- ChangeServicesFlag: True if services run as this user should be updated with the new password after a password change, otherwise false.
- RestartServicesFlag: True if services should be restarted after the run as password is changed (ChangeServicesFlag),
  otherwise false.
- ChangeTasksFlag: True if scheduled tasks run as this user should be updated with the new password after a password change, otherwise false.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- MaxConcurrentRequests: (0-999, default: 1) Maximum number of concurrent password requests for this account. A value of zero denotes unlimited requests.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - DSSAutoManagementFlag: True if DSS key auto-management is enabled, otherwise false.
  - CheckPasswordFlag: True to enable password testing, otherwise false.

- ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
- ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
- **ChangeFrequencyType:** The change frequency for scheduled password changes:
  - first: Changes scheduled for the first day of the month.
  - last: Changes scheduled for the last day of the month.
  - xdays: Changes scheduled every x days (ChangeFrequencyDays).
- ChangeFrequencyDays: (days: 1-999) When ChangeFrequencyType is xdays, password changes take place this
  configured number of days.
- ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- ParentAccountID: If this is a subscribed account (IsSubscribedAccount), this is the ID of the parent managed account.
- IsSubscribedAccount: True if the account is a synced or subscribed account, otherwise false.
- LastChangeDate: The date and time of the last password change.
- NextChangeDate: The date and time of the next scheduled password change.
- IsChanging: True if the account credentials are in the process of changing, otherwise false.
- ChangeState: The change state of the account credentials:
  - 0: Idle / No change taking place or scheduled within 5 minutes.
  - 1: Changing / Managed Account Credential currently changing.
  - 2: Queued / Managed Account Credential is queued to change or scheduled to change within 5 minutes.
- UseOwnCredentials: True if the current account credentials should be used during change operations, otherwise false.
- · WorkgroupID: ID of the assigned Workgroup.
- ObjectID: (required when Platform.RequiresObjectID is true). ObjectID of the account (if applicable).

  ChangeComPlusFlag : bool,
  ChangeDComFlag : bool,
  ChangeSComFlag : bool,

ObjectID : string
}
```

#### **Request Body Details**

- AccountName: (required) The name of the account. Must be unique on the system. Max string length is 245.
- ManagedSystemID: (required) ID of the managed system.
- Password: (required if AutoManagementFlag is false) The account password.
- **DomainName:** (optional) This can be given but it must be exactly the same as the directory. If empty or null, it is automatically populated from the parent managed system/directory. Max string length is 50.
- **UserPrincipalName:** (required for Active Directory managed systems only) The Active Directory user principal name. Max string length is 500.
- **SAMAccountName:** (required for Active Directory managed systems only) The Active Directory SAM account name (maximum 20 characters). Max string length is 20.
- **DistinguishedName:** (required for LDAP Directory managed systems only) The LDAP distinguished name. Max string length is 1000.
- PrivateKey: DSS private key. Can be set if Platform.DSSFlag is true.
- Passphrase: (required when PrivateKey is an encrypted DSS key) DSS passphrase. Can be set if Platform.DSSFlag is true.
- PasswordFallbackFlag: (default: false) True if failed DSS authentication can fall back to password authentication, otherwise false. Can be set if Platform.DSSFlag is true.
- LoginAccountFlag: True if the account should use the managed system login account for SSH sessions, otherwise false. Can be set when the ManagedSystem.LoginAccountID is set.
- Description: A description of the account. Max string length is 1024.
- PasswordRuleID: (default: 0) ID of the password rule assigned to this managed account.
- ApiEnabled: (default: false) True if the account can be requested through the API, otherwise false.
- ReleaseNotificationEmail: Email address used for notification emails related to this managed account. Max string length is 255.
- ChangeServicesFlag: (default: false) True if services run as this user should be updated with the new password after a password change, otherwise false.
- **RestartServicesFlag:** (default: false) True if services should be restarted after the run as password is changed (**ChangeServicesFlag**), otherwise false.
- ChangeTasksFlag: (default: false) True if scheduled tasks run as this user should be updated with the new password after a password change, otherwise false.
- ReleaseDuration: (minutes: 1-525600, default: 120) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600, default: 525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600, default: 120) Default Information Systems Administrator (ISA) release duration.
- MaxConcurrentRequests: (0-999, 0 is unlimited, default: 1) Maximum number of concurrent password requests for this account.
- AutoManagementFlag: (default: false) True if password auto-management is enabled, otherwise false.
  - DSSAutoManagementFlag: (default: false) True if DSS key auto-management is enabled, otherwise false. If set to true, and no PrivateKey is provided, immediately attempts to generate and set a new public key on the server. Can be set if

Platform.DSSAutoManagementFlag is true.

- CheckPasswordFlag: (default: false) True to enable password testing, otherwise false.
- ChangePasswordAfterAnyReleaseFlag: (default: false) True to change passwords on release of a request, otherwise false.
- ResetPasswordOnMismatchFlag: (default: false) True to queue a password change when scheduled password test fails, otherwise false.
- ChangeFrequencyType: (default: first) The change frequency for scheduled password changes:
  - first: Changes scheduled for the first day of the month.
  - last: Changes scheduled for the last day of the month.
  - xdays: Changes scheduled every x days (ChangeFrequencyDays).
- ChangeFrequencyDays: (days: 1-999) When ChangeFrequencyType is xdays, password changes take place this
  configured number of days.
- o ChangeTime: (24hr format: 00:00-23:59, default: 23:30) UTC time of day scheduled password changes take place.
- NextChangeDate: (date format: YYYY-MM-DD) UTC date when next scheduled password change occurs. If the NextChangeDate + ChangeTime is in the past, password change occurs at the nearest future ChangeTime.
- **UseOwnCredentials:** (version 3.1+) True if the current account credentials should be used during change operations, otherwise false.
- ChangellSAppPoolFlag: (version 3.2 only) True if IIS Application Pools run, as this user should be updated with the new password after a password change, otherwise false.
- **RestartIISAppPoolFlag:** (version 3.2 only) True if IIS Application Pools should be restarted after the run as password is changed (**ChangeIISAppPoolFlag**), otherwise false.
- WorkgroupID: ID of the assigned Workgroup.
- ChangeWindowsAutoLogonFlag: (default: false) True if Windows Auto Logon should be updated with the new password after a password change, otherwise false.
- ChangeComPlusFlag: (default: false) True if COM+ Apps should be updated with the new password after a password change, otherwise false.
- ChangeDComFlag: (default: false) True if DCOM Apps should be updated with the new password after a password change, otherwise false.
- ChangeSComFlag: (default: false) True if SCOM Identities should be updated with the new password after a password change, otherwise false.
- ObjectID: (required when Platform.RequiresObjectID is true). ObjectID of the account (if applicable). Max string length is 36.

## Response Body

```
ManagedAccountID : int,
ManagedSystemID : int,
DomainName : string,
AccountName : string,
DistinguishedName : string,

```

## **Response Codes**

200 - Request successful. Managed Account in the response body.

For more information, please see "Common Response Codes" on page 16.

## POST ManagedSystems/{systemID}/ManagedAccounts

#### **Purpose**

Creates a new managed account in the managed system referenced by ID.

#### **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

systemID: ID of the managed system.

### **Query Parameters**

version: (optional, default: 3.0) Request body model version (3.0, 3.1, 3.2, 3.3, 3.4, 3.5).

## Request Body (version 3.0)

```
AccountName : string,
Password : string,
DomainName : string,
UserPrincipalName : string,
SAMAccountName : string,
DistinguishedName : string,
PrivateKey: string,
Passphrase : string,
PasswordFallbackFlag : bool,
LoginAccountFlag : bool,
Description : string,
PasswordRuleID : int,
ApiEnabled : bool,
ReleaseNotificationEmail: string,
ChangeServicesFlag: bool,
RestartServicesFlag: bool,
ChangeTasksFlag : bool,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
MaxConcurrentRequests : int,
AutoManagementFlag : bool,
DSSAutoManagementFlag : bool,
CheckPasswordFlag : bool,
```

```
ResetPasswordOnMismatchFlag : bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
NextChangeDate : date-formatted string
}
```

#### **Request Body (version 3.1)**

Content-Type: application/json

```
AccountName : string,
Password : string,
DomainName : string,
UserPrincipalName : string,
SAMAccountName : string,
DistinguishedName : string,
PrivateKey: string,
Passphrase : string,
PasswordFallbackFlag : bool,
LoginAccountFlag : bool,
Description : string,
PasswordRuleID : int,
ApiEnabled : bool,
ReleaseNotificationEmail: string,
ChangeServicesFlag: bool,
RestartServicesFlag: bool,
ChangeTasksFlag : bool,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
MaxConcurrentRequests : int,
AutoManagementFlag : bool,
DSSAutoManagementFlag : bool,
CheckPasswordFlag : bool,
ResetPasswordOnMismatchFlag : bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
NextChangeDate : date-formatted string,
UseOwnCredentials : bool
```

## **Request Body (version 3.2)**

```
AccountName : string,
Password : string,
DomainName : string,
UserPrincipalName : string,
SAMAccountName : string,
DistinguishedName : string,
PrivateKey: string,
Passphrase : string,
PasswordFallbackFlag : bool,
LoginAccountFlag : bool,
Description : string,
PasswordRuleID : int,
ApiEnabled : bool,
ReleaseNotificationEmail: string,
ChangeServicesFlag: bool,
RestartServicesFlag: bool,
ChangeTasksFlag : bool,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
MaxConcurrentRequests : int,
AutoManagementFlag: bool,
DSSAutoManagementFlag: bool,
CheckPasswordFlag : bool,
ResetPasswordOnMismatchFlag : bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
NextChangeDate : date-formatted string,
UseOwnCredentials : bool,
ChangeIISAppPoolFlag : bool,
RestartIISAppPoolFlag : bool
```

## **Request Body (version 3.3)**

```
AccountName: string,
Password: string,
DomainName: string,
UserPrincipalName: string,
SAMAccountName: string,
DistinguishedName: string,
PrivateKey: string,
Passphrase: string,
PasswordFallbackFlag: bool,
LoginAccountFlag: bool,
Description: string,
```

```
PasswordRuleID : int,
ApiEnabled : bool,
ReleaseNotificationEmail: string,
ChangeServicesFlag : bool,
RestartServicesFlag : bool,
ChangeTasksFlag : bool,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
MaxConcurrentRequests : int,
AutoManagementFlag: bool,
DSSAutoManagementFlag : bool,
CheckPasswordFlag : bool,
ResetPasswordOnMismatchFlag : bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
NextChangeDate : date-formatted string,
UseOwnCredentials : bool,
ChangeIISAppPoolFlag : bool,
RestartIISAppPoolFlag: bool,
WorkgroupID : int // can be null
```

#### **Request Body (version 3.4)**

```
AccountName : string,
Password : string,
DomainName : string,
UserPrincipalName : string,
SAMAccountName : string,
DistinguishedName : string,
PrivateKey: string,
Passphrase : string,
PasswordFallbackFlag : bool,
LoginAccountFlag : bool,
Description : string,
PasswordRuleID : int,
ApiEnabled : bool,
ReleaseNotificationEmail: string,
ChangeServicesFlag : bool,
RestartServicesFlag : bool,
ChangeTasksFlag : bool,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
MaxConcurrentRequests : int,
```

```
AutoManagementFlag : bool,
DSSAutoManagementFlag : bool,
CheckPasswordFlag : bool,
ResetPasswordOnMismatchFlag : bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
NextChangeDate : date-formatted string,
UseOwnCredentials : bool,
ChangeIISAppPoolFlag : bool,
RestartIISAppPoolFlag : bool,
WorkgroupID : int // can be null,
ChangeWindowsAutoLogonFlag: bool,
ChangeComPlusFlag : bool,
ChangeDComFlag : bool,
ChangeSComFlag: bool,
```

#### **Request Body (version 3.5)**

```
AccountName : string,
Password: string,
DomainName : string,
UserPrincipalName : string,
SAMAccountName : string,
DistinguishedName : string,
PrivateKey: string,
Passphrase : string,
PasswordFallbackFlag : bool,
LoginAccountFlag : bool,
Description : string,
PasswordRuleID : int,
ApiEnabled : bool,
ReleaseNotificationEmail: string,
ChangeServicesFlag : bool,
RestartServicesFlag : bool,
ChangeTasksFlag : bool,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
MaxConcurrentRequests : int,
AutoManagementFlag : bool,
    DSSAutoManagementFlag : bool,
    CheckPasswordFlag : bool,
    ResetPasswordOnMismatchFlag : bool,
    ChangePasswordAfterAnyReleaseFlag : bool,
```

```
ChangeFrequencyDays: int,
ChangeTime: string,
NextChangeDate: date-formatted string,

UseOwnCredentials: bool,
ChangeIISAppPoolFlag: bool,
RestartIISAppPoolFlag: bool,
WorkgroupID: int // can be null,
ChangeWindowsAutoLogonFlag: bool,
ChangeComPlusFlag: bool,
ChangeComFlag: bool,
ChangeSComFlag: bool,
ObjectID: string
}
```

#### **Request Body Details**

- AccountName: (required) The name of the account. Must be unique on the system. Max string length is 245.
- Password: (required if AutoManagementFlag is false) The account password.
- **DomainName:** (optional) This can be given but it must be exactly the same as the directory. If empty or null, it is automatically populated from the parent managed system/directory. Max string length is 50.
- **UserPrincipalName:** (required for Active Directory and Azure Active Directory managed systems only) The Active Directory user principal name. Max string length is 500.
- SAMAccountName: (required for Active Directory managed systems, optional for Azure Active Directory managed systems) The Active Directory SAM account name (Maximum 20 characters). Max string length is 20.
- **DistinguishedName:** (required for LDAP Directory managed systems only) The LDAP distinguished name. Max string length is 1000
- PrivateKey: DSS private key. Can be set if Platform.DSSFlag is true.
- Passphrase: (required when PrivateKey is an encrypted DSS key) DSS passphrase. Can be set if Platform.DSSFlag is true.
- PasswordFallbackFlag: (default: false) True if failed DSS authentication can fall back to password authentication, otherwise false. Can be set if Platform.DSSFlag is true.
- LoginAccountFlag: True if the account should use the managed system login account for SSH sessions, otherwise false. Can be set when the ManagedSystem.LoginAccountID is set.
- Description: A description of the account. Max string length is 1024.
- PasswordRuleID: (default: 0) ID of the password rule assigned to this managed account.
- ApiEnabled: (default: false) True if the account can be requested through the API, otherwise false.
- ReleaseNotificationEmail: Email address used for notification emails related to this managed account. Max string length is 255.
- ChangeServicesFlag: (default: false) True if services run as this user should be updated with the new password after a password change, otherwise false.
- **RestartServicesFlag:** (default: false) True if services should be restarted after the run as password is changed (**ChangeServicesFlag**), otherwise false.
- ChangeTasksFlag: (default: false) True if scheduled tasks run as this user should be updated with the new password after a password change, otherwise false.
- ReleaseDuration: (minutes: 1-525600, default: 120) Default release duration.

**API GUIDE** 

- MaxReleaseDuration: (minutes: 1-525600, default: 525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600, default: 120) Default Information Systems Administrator (ISA) release duration.
- MaxConcurrentRequests: (0-999, 0 is unlimited, default: 1) Maximum number of concurrent password requests for this account.
- AutoManagementFlag: (default: false) True if password auto-management is enabled, otherwise false.
  - DSSAutoManagementFlag: (default: false) True if DSS key auto-management is enabled, otherwise false. If set to true, and no PrivateKey is provided, immediately attempts to generate and set a new public key on the server. Can be set if Platform.DSSAutoManagementFlag is true.
  - CheckPasswordFlag: (default: false) True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: (default: false) True to change passwords on release of a request, otherwise
    false.
  - ResetPasswordOnMismatchFlag: (default: false) True to queue a password change when scheduled password test fails, otherwise false.
  - ChangeFrequencyType: (default: first) The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-999) When ChangeFrequencyType is xdays, password changes take place this
    configured number of days.
  - o ChangeTime: (24hr format: 00:00-23:59, default: 23:30) UTC time of day scheduled password changes take place.
  - NextChangeDate: (date format: YYYY-MM-DD) UTC date when next scheduled password change occurs. If the NextChangeDate + ChangeTime is in the past, password change occurs at the nearest future ChangeTime.
- **UseOwnCredentials:** (version 3.1+) True if the current account credentials should be used during change operations, otherwise false.
- ChangellSAppPoolFlag: (version 3.2 only) True if IIS application pools run as this user should be updated with the new password after a password change, otherwise false.
- **RestartIISAppPoolFlag:** (version 3.2 only) True if IIS application pools should be restarted after the run as password is changed (**ChangeIISAppPoolFlag**), otherwise false.
- WorkgroupID: ID of the assigned Workgroup.
- ChangeWindowsAutoLogonFlag: (default: false) True if Windows Auto Logon should be updated with the new password after a password change, otherwise false.
- ChangeComPlusFlag: (default: false) True if COM+ Apps should be updated with the new password after a password change, otherwise false.
- ChangeDComFlag: (default: false) True if DCOM Apps should be updated with the new password after a password change, otherwise false.
- ChangeSComFlag: (default: false) True if SCOM Identities should be updated with the new password after a password change, otherwise false.
- ObjectID: (required when Platform.RequiresObjectID is true). ObjectID of the account (if applicable). Max string length is 36.

```

## **Response Body Details**

- AccountName: The name of the account.
- PasswordFallbackFlag: True if failed DSS authentication can fall back to password authentication, otherwise false.
- **UserPrincipalName:** (Active Directory and Azure Active Directory managed systems only) The account user principal name of an Active Directory account.

- **SAMAccountName:** (Active Directory managed systems, optional for Azure Active Directory managed systems) The account SAM account name of an Active Directory account.
- LoginAccountFlag: True if the account should use the managed system login account for SSH sessions, otherwise false.
- Description: A description of the account.
- PasswordRuleID: ID of the password rule assigned to this managed account.
- ApiEnabled: True if the account can be requested through the API, otherwise false.
- ReleaseNotificationEmail: Email address used for notification emails related to this managed account.
- ChangeServicesFlag: True if services run as this user should be updated with the new password after a password change, otherwise false.
- RestartServicesFlag: True if services should be restarted after the run as password is changed (ChangeServicesFlag),
  otherwise false.
- ChangeTasksFlag: True if scheduled tasks run as this user should be updated with the new password after a password change, otherwise false.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- MaxConcurrentRequests: (0-999, 0 means unlimited) Maximum number of concurrent password requests for this account.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - DSSAutoManagementFlag: True if DSS key auto-management is enabled, otherwise false.
  - o CheckPasswordFlag: True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - ChangeFrequencyType: The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-999) When ChangeFrequencyType is xdays, password changes take place this
    configured number of days.
  - ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- ParentAccountID: If this is a subscribed account, this is the ID of the parent managed account.
- IsSubscribedAccount: True if the account is a synced or subscribed account, otherwise false.
- LastChangeDate: The date and time of the last password change.
- NextChangeDate: The date and time of the next scheduled password change.
- IsChanging: True if the account credentials are in the process of changing, otherwise false.
- ChangeState: The change state of the account credentials:
  - 0: Idle / no change taking place or scheduled within 5 minutes.
  - 1: Changing / managed account credential currently changing.
  - 2: Queued / managed account credential is queued to change or scheduled to change within 5 minutes.
- **UseOwnCredentials:** True if the current account credentials should be used during change operations, otherwise false.

- ChangellSAppPoolFlag: True if IIS application pools run as this user should be updated with the new password after a password change, otherwise false.
- RestartIISAppPoolFlag: True if IIS application pools should be restarted after the run as password is changed, otherwise false.
- WorkgroupID: ID of the assigned Workgroup.
- ChangeWindowsAutoLogonFlag: True if Windows auto logon should be updated with the new password after a password change, otherwise false.
- ChangeComPlusFlag: True if COM+ apps should be updated with the new password after a password change, otherwise false.
- ChangeDComFlag: True if DCOM apps should be updated with the new password after a password change, otherwise false.
- ChangeSComFlag: True if SCOM identities should be updated with the new password after a password change, otherwise false.
- ObjectID: ObjectID of the account (if applicable).

For more information, please see <u>Configure Subscriber Accounts</u> at <u>https://www.beyondtrust.com/docs/beyondinsight-password-safe/ps/admin/managed-accounts.htm</u>#ConfigureAccounts.

## **Response Codes**

201 - Request successful. Managed Account in the response body.

# **DELETE ManagedAccounts/{id}**

#### **Purpose**

Deletes a managed account by ID.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

id: ID of the managed account.

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

# DELETE ManagedSystems/{systemID}/ManagedAccounts/ {accountName}

## **Purpose**

Deletes a managed account by managed system ID and managed account name.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

- systemID: ID of the managed system.
- · accountName: Name of the managed account.

#### **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

# **DELETE ManagedSystems/{id}/ManagedAccounts**

#### **Purpose**

Deletes all managed accounts on the managed system by ID.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

• id: ID of the managed system.

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

# **Managed Account Credentials**

#### **Quick Navigation**

- "PUT ManagedAccounts/{managedAccountID}/Credentials" on page 260
- "PUT Credentials?workgroupName={workgroupName}&assetName={assetName}&accountName={accountName}" on page 261
- "POST ManagedAccounts/{managedAccountID}/Credentials/Test" on page 262
- "POST ManagedAccounts/{managedAccountID}/Credentials/Change" on page 263
- "POST ManagedSystems/{systemId}/ManagedAccounts/Credentials/Change" on page 264

# PUT ManagedAccounts/{managedAccountID}/Credentials

## **Purpose**

Updates the credentials for a managed account, optionally applying the change to the managed system.

## **Required Permissions**

Requires one of the following:

- · Password Safe Account Management (Read/Write).
- ISA Role or Credentials Manager Role on a Smart Rule referencing the account.

#### **URL Parameters**

managedAccountID: ID of the managed account for which to set the credentials.

## **Request Body**

Content-Type: application/json

```
Password: string,
PublicKey: string,
PrivateKey: string,
Passphrase: string,
UpdateSystem: bool
}
```

## **Request Body Details**

- Password: (optional) The new password to set. If not given, generates a new random password.
- PublicKey: (required if PrivateKey is given and updateSystem = true) The new public key to set on the host.

- PrivateKey: The private key to set (provide passphrase if encrypted).
- Passphrase: (optional) The passphrase to use for an encrypted private key.
- UpdateSystem: (default: true) Whether to update the credentials on the referenced system.

#### **Response Body**

None.

#### **Response Codes**

204 - Request successful. No content in body.

For more information, please see "Common Response Codes" on page 16.

# PUT Credentials?workgroupName={workgroupName}&assetName={assetName}&accountName={accountName}

#### **Purpose**

Updates the credentials for a managed account by Workgroup name, asset name, and managed account name, optionally applying the change to the managed system.

## **Required Permissions**

Requires one of the following:

- · Password Safe Account Management (Read/Write).
- ISA Role or Credentials Manager Role on a Smart Rule referencing the account.

## **Query Parameters**

- · workgroupName: Name of the Workgroup.
- assetName: Name of the asset.
- accountName: Name of the managed account for which to set the credentials.

# **Request Body**

Content-Type: application/json

```
{
    Password: string,
    PublicKey: string,
```

```
PrivateKey: string,
Passphrase: string,
UpdateSystem: bool
}
```

## **Request Body Details**

- Password: (optional) The new password to set. If not given, generates a new random password.
- PublicKey: (required if PrivateKey is given and updateSystem = true) The new public key to set on the host.
- PrivateKey: The private key to set (provide passphrase if encrypted).
- Passphrase: (optional) The passphrase to use for an encrypted private key.
- UpdateSystem: (default: true) Whether to update the credentials on the referenced system.

#### **Response Body**

None.

#### **Response Codes**

204 - Request Successful. No Response Body.

For more information, please see "Common Response Codes" on page 16.

# POST ManagedAccounts/{managedAccountID}/Credentials/Test

## **Purpose**

Tests the current credentials of a managed account.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

managedAccountID: ID of the managed account.

## **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
{
    Success: bool
}
```

## **Response Body Details**

Success: True if the credential test succeeded, otherwise false.

#### **Response Codes**

200 - Request Successful.

For more information, please see "Common Response Codes" on page 16.

# POST ManagedAccounts/{managedAccountID}/Credentials/Change

## **Purpose**

Changes the current credentials of a managed account.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

managedAccountID: ID of the managed account.

## **Request Body (optional)**

```
{
   Queue : bool
}
```

## **Request Body Details**

**Queue:** (default: false) True to queue the change for background processing, otherwise false. When **Queue** is false the credentials change is immediate.

## **Response Body**

None.

#### **Response Codes**

204 - Request successful. No content in body.

For more information, please see "Common Response Codes" on page 16.

# POST ManagedSystems/ {systemId}/ManagedAccounts/Credentials/Change

#### **Purpose**

Queues credentials' changes for all active managed accounts for a managed system.

## **Required Permissions**

Password Safe API Global Quarantine (Read/Write).

#### **URL Parameters**

systemid: ID of the managed system.

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

204 - Request successful. No content in body.

# **Quick Rule Managed Accounts**

## **Quick Navigation**

- "GET QuickRules/{quickRuleID}/ManagedAccounts" on page 266

## **Response Body Details**

- DomainName: The domain name for a domain-type account.
- · AccountName: The name of the account.
- DistinguishedName: The distinguished name of an LDAP managed account.
- PasswordFallbackFlag: True if failed DSS authentication can fall back to password authentication, otherwise false.
- LoginAccountFlag: True if the account should use the managed system login account for SSH sessions, otherwise false.
- Description: A description of the account.
- PasswordRuleID: ID of the password rule assigned to this managed account.
- ApiEnabled: True if the account can be requested through the API, otherwise false.
- ReleaseNotificationEmail: Email address used for notification emails related to this managed account.
- ChangeServicesFlag: True if services run as this user should be updated with the new password after a password change, otherwise false.
- RestartServicesFlag: True if services should be restarted after the run as password is changed (ChangeServicesFlag),
  otherwise false.

- ChangeTasksFlag: True if scheduled tasks run as this user should be updated with the new password after a password change, otherwise false.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- MaxConcurrentRequests: (0-999, 0 is unlimited) Maximum number of concurrent password requests for this account.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - DSSAutoManagementFlag: True if DSS key auto-management is enabled, otherwise false.
  - CheckPasswordFlag: True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - **ChangeFrequencyType:** The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-999) When ChangeFrequencyType is xdays, password changes take place this
    configured number of days.
  - ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- ParentAccountID: If this is a subscribed account (IsSubscribedAccount), this is the ID of the parent managed account.
- IsSubscribedAccount: True if the account is a synced or subscribed account, otherwise false.
- LastChangeDate: The date and time of the last password change.
- NextChangeDate: The date and time of the next scheduled password change.
- IsChanging: True if the account credentials are in the process of changing, otherwise false.
- ChangeState: The change state of the account credentials:
  - **0:** Idle / no change taking place or scheduled within 5 minutes.
  - 1: Changing / managed account credential currently changing.
  - 2: Queued / managed account credential is queued to change or scheduled to change within 5 minutes.
- UseOwnCredentials: True if the current account credentials should be used during change operations, otherwise false.
- ChangellSAppPoolFlag: True if IIS application pools run as this user should be updated with the new password after a password change, otherwise false.
- RestartIISAppPoolFlag: True if IIS application pools should be restarted after the run as password is changed, otherwise false.
- · WorkgroupID: ID of the assigned Workgroup.

## PUT QuickRules/{quickRuleID}/ManagedAccounts

### **Purpose**

Updates the entire list of managed accounts in a Quick Rule by removing all **Managed Account Fields - Quick Group ID** filters and adding a new one with the managed accounts referenced by ID.

#### **Required Permissions**

- · Password Safe Account Management (Read).
- Read/Write access to the Quick Rule.

#### **URL Parameters**

quickRuleID: ID of the Quick Rule.

#### **Request Body**

Content-Type: application/json

```
{
    AccountIDs: [ int, ...]
}
```

## **Response Body**

```
ManagedAccountID : int,
    ManagedSystemID : int,
    DomainName : string,
    AccountName : string,
    DistinguishedName : string,
    PasswordFallbackFlag : bool,
    LoginAccountFlag : bool,
    Description : string,
    PasswordRuleID : int,
    ApiEnabled : bool,
    ReleaseNotificationEmail : string,
    ChangeServicesFlag : bool,
    RestartServicesFlag : bool,
```

**API GUIDE** 

```
ChangeTasksFlag : bool,
   ReleaseDuration : int,
   MaxReleaseDuration : int,
   ISAReleaseDuration : int,
   MaxConcurrentRequests : int,
   AutoManagementFlag: bool,
   DSSAutoManagementFlag : bool,
   CheckPasswordFlag : bool,
   ResetPasswordOnMismatchFlag : bool,
   ChangePasswordAfterAnyReleaseFlag : bool,
   ChangeFrequencyType : string,
   ChangeFrequencyDays : int,
   ChangeTime : string,
   ParentAccountID : int, // can be null
   IsSubscribedAccount : bool,
   LastChangeDate: datetime, // can be null
   NextChangeDate: datetime, // can be null
   IsChanging: bool,
   ChangeState : int,
   UseOwnCredentials : bool,
   ChangeIISAppPoolFlag: bool,
   RestartIISAppPoolFlag: bool,
   WorkgroupID : int // can be null
   ChangeWindowsAutoLogonFlag: bool,
   ChangeComPlusFlag : bool,
   ChangeDComFlag : bool,
   ChangeSComFlag : bool,
},
```

## **Response Body Details**

- DomainName: The domain name for a domain-type account.
- AccountName: The name of the account.
- DistinguishedName: The distinguished name of an LDAP managed account.
- PasswordFallbackFlag: True if failed DSS authentication can fall back to password authentication, otherwise false.
- LoginAccountFlag: True if the account should use the managed system login account for SSH sessions, otherwise false.
- Description: A description of the account.
- PasswordRuleID: ID of the password rule assigned to this managed account.
- ApiEnabled: True if the account can be requested through the API, otherwise false.
- ReleaseNotificationEmail: Email address used for notification emails related to this managed account.
- ChangeServicesFlag: True if services run as this user should be updated with the new password after a password change, otherwise false.
- RestartServicesFlag: True if services should be restarted after the run as password is changed (ChangeServicesFlag), otherwise false.
- ChangeTasksFlag: True if scheduled tasks run as this user should be updated with the new password after a password change, otherwise false.

- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- MaxConcurrentRequests: (0-999, 0 is unlimited) Maximum number of concurrent password requests for this account.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - DSSAutoManagementFlag: True if DSS key auto-management is enabled, otherwise false.
  - **CheckPasswordFlag:** True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - **ChangeFrequencyType:** The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.

200 – Request successful. Managed Accounts in the response body.

For more information, please see "Common Response Codes" on page 16.

# DELETE QuickRules/{quickRuleID}/ManagedAccounts/{accountID}

#### **Purpose**

Removes the managed account referenced by ID from the Quick Rule by removing it from all **Managed Account Fields - Quick Group ID** filters found.

#### **IMPORTANT!**

A rule cannot be left in an invalid state. If removing the account would result in an empty filter, the filter itself will be removed. If there are no filters left in the rule, a "400 Bad Request" is returned.

- If you intend to replace all accounts in the rule, see "PUT QuickRules/{quickRuleID}/ManagedAccounts" on page 269.
- If you intend to delete the rule, see "DELETE QuickRules/{id}" on page 368.

## **Required Permissions**

· Read/Write access to the Quick Rule.

#### **URL Parameters**

- · quickRuleID: ID of the Quick Rule.
- · accountID: ID of the managed account.

## **Request Body**

None.

## **Response Codes**

200 - Request successful.

# **Smart Rule Managed Accounts**

# GET SmartRules/{smartRuleID}/ManagedAccounts

## **Purpose**

Returns a list of managed accounts by Smart Rule ID.

## **Required Permissions**

Read access to the Smart Rule.

#### **URL Parameters**

smartRuleID: ID of the Smart Rule.

## **Request Body**

None.

## **Response Body**

```
ManagedAccountID : int,

- "DELETE ManagedAccounts/{accountID}/Applications/{applicationID}" on page 281
- "DELETE ManagedAccounts/{accountID}/Applications" on page 282

## **GET ManagedAccounts/{accountID}/Applications**

## **Purpose**

Returns a list of applications assigned to a managed account.

## **Required Permissions**

Password Safe Account Management (Read).

#### **URL Parameters**

accountID: ID of the managed account.

## **Request Body**

None.

## **Response Body**

```
{
    ApplicationID : int,
    Name : string,
    DisplayName : string,
    Version : string,
    Command : string,
    Parameters : string,
    Publisher : string,
    ApplicationType : string,
    FunctionalAccountID : int, // can be null
    ManagedSystemID : int, // can be null
    IsActive : bool,
```

```
SmartRuleID : int // can be null
}
...
]
```

200 - Request successful. Applications in response body.

For more information, please see "Common Response Codes" on page 16.

## POST ManagedAccounts/{accountID}/Applications/{applicationID}

## **Purpose**

Assigns an application to a managed account.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

- · accountID: ID of the managed account.
- applicationID: ID of the application.

## **Request Body**

None.

## **Response Body**

```
ApplicationID : int,
Name : string,
DisplayName : string,
Version : string,
Command : string,
Parameters : string,
Publisher : string,
ApplicationType : string,
```

```
FunctionalAccountID : int, // can be null
ManagedSystemID : int, // can be null
IsActive : bool,
SmartRuleID : int // can be null
}
```

201 - Request successful. Application in response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE ManagedAccounts/{accountID}/Applications/{applicationID}**

#### **Purpose**

Unassigns an application from a managed account by managed account ID and application ID.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

- · accountID: ID of the managed account.
- applicationID: ID of the application.

## **Request Body**

None.

# Response Body

None.

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **DELETE ManagedAccounts/{accountID}/Applications**

#### **Purpose**

Unassigns all managed account applications by managed account ID.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

- · accountID: ID of the managed account.
- · applicationID: ID of the application.

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful.

   ChangeTime : string,
   RemoteClientType : string,
   ApplicationHostID : int, // can be null
   IsApplicationHost: bool,
   AccessURL : string
},
```

#### Response Body Details

- ManagedSystemID: ID of the managed system.
- AssetD: Asset ID; set if the managed system is an asset or a database.
- DatabaseID: Database ID; set if the managed system is a database.
- **DirectoryID:** Directory ID; set if the managed system is a directory.
- CloudID: Cloud system ID; set if the managed system is a cloud system.
- SystemName: Name of the related entity (asset, directory, database, or cloud).
- PlatformID: ID of the managed system platform.
- NetBiosName: (Managed domains only) Domain NetBIOS name. Setting this value will allow Password Safe to fall back to the NetBIOS name if needed.
- Port: The port used to connect to the host. If null and the related **Platform.PortFlag** is true, Password Safe uses **Platform.DefaultPort** for communication.
- Timeout: (seconds) Connection timeout. Length of time in seconds before a slow or unresponsive connection to the system fails.
- SshKeyEnforcementMode: Enforcement mode for SSH host keys.
  - 0: None
  - 1: Auto. Auto accept initial key.
  - o 2: Strict. Manually accept keys.

- PasswordRuleID: ID of the default password rule assigned to managed accounts created under this managed system.
- DSSKeyRuleID: ID of the default DSS key rule assigned to managed accounts created under this managed system.
- LoginAccountID: ID of the functional account used for SSH session logins.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - FunctionalAccountID: ID of the functional account used for local managed account password changes.
  - ElevationCommand: Elevation command to use (sudo, pbrun, pmrun).
  - CheckPasswordFlag: True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - **ChangeFrequencyType:** The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (see ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-90) When ChangeFrequencyType is xdays, password changes take place this configured number of days.
  - ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- RemoteClientType: The type of remote client to use.
  - o None: No remote client.
  - EPM: Endpoint Privilege Management.
- **ApplicationHostID:** Managed system ID of the target application host. Must be an ID of a managed system whose IsApplicationHost = true.
- **IsApplicationHost:** True if the managed system can be used as an application host, otherwise false. Can be set when the Platform.ApplicationHostFlag = true, and cannot be set when ApplicationHostID has a value.
- · AccessURL: The URL used for cloud access (applies to cloud systems only).

200 - Request successful. Managed System in response body.

## **GET ManagedSystems**

#### **Purpose**

Returns a list of managed systems.

#### **Required Permissions**

Password Safe System Management (Read).

#### **Query Parameters (Optional)**

- type: The entity type of the managed system.
- name: The name of the managed system.
- limit: (default: 100000) Number of records to return.
- · offset: (default: 0) Number of records to skip before returning records (can only be used in conjunction with limit).

## **Request Body**

None.

## Response Body (when limit is not given)

```

- ManagedSystemID: ID of the managed system.
- AssetD: Asset ID; set if the managed system is an asset or a database.
- DatabaseID: Database ID; set if the managed system is a database.
- DirectoryID: Directory ID; set if the managed system is a directory.
- CloudID: Cloud system ID; set if the managed system is a cloud system.
- SystemName: Name of the related entity (asset, directory, database, or cloud).
- · PlatformID: ID of the managed system platform.

- NetBiosName: (Managed domains only) Domain NetBIOS name. Setting this value will allow Password Safe to fall back to the NetBIOS name if needed.
- Port: The port used to connect to the host. If null and the related **Platform.PortFlag** is true, Password Safe uses **Platform.DefaultPort** for communication.
- Timeout: (seconds) Connection timeout. Length of time in seconds before a slow or unresponsive connection to the system fails.
- SshKeyEnforcementMode: Enforcement mode for SSH host keys.
  - **0:** None.
  - 1: Auto. Auto accept initial key.
  - o 2: Strict. Manually accept keys.
- PasswordRuleID: ID of the default password rule assigned to managed accounts created under this managed system.
- DSSKeyRuleID: ID of the default DSS key rule assigned to managed accounts created under this managed system.
- LoginAccountID: ID of the functional account used for SSH session logins.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - FunctionalAccountID: ID of the functional account used for local managed account password changes.
  - ElevationCommand: Elevation command to use (sudo, pbrun, pmrun).
  - o CheckPasswordFlag: True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - **ChangeFrequencyType:** The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (see ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-90) When ChangeFrequencyType is xdays, password changes take place this
    configured number of days.
  - ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- RemoteClientType: The type of remote client to use.
  - o None: No remote client.
  - EPM: Endpoint Privilege Management.
- ApplicationHostID: Managed system ID of the target application host. Must be an ID of a managed system whose IsApplicationHost = true.
- **IsApplicationHost:** True if the managed system can be used as an application host, otherwise false. Can be set when the Platform.ApplicationHostFlag = true, and cannot be set when ApplicationHostID has a value.
- AccessURL: The URL used for cloud access (applies to cloud systems only).

# **Response Codes**

200 - Request successful. Managed system in response body.

# **GET Assets/{assetId}/ManagedSystems**

#### **Purpose**

Returns a managed system for the asset referenced by ID.

### **Required Permissions**

Password Safe System Management (Read).

#### **URL Parameters**

assetId: ID of the asset.

## **Request Body**

None.

# **Response Body Details**

- ManagedSystemID: ID of the managed system.
- AssetD: Asset ID; set if the managed system is an asset or a database.

TC: 11/7/2023

- DatabaseID: Database ID; set if the managed system is a database.
- DirectoryID: Directory ID; set if the managed system is a directory.
- CloudID: Cloud system ID; set if the managed system is a cloud system.
- SystemName: Name of the related entity (asset, directory, database, or cloud).
- · PlatformID: ID of the managed system platform.
- NetBiosName: (Managed domains only) Domain NetBIOS name. Setting this value will allow Password Safe to fall back to the NetBIOS name if needed.
- Port: The port used to connect to the host. If null and the related Platform.PortFlag is true, Password Safe uses Platform.DefaultPort for communication.
- Timeout: (seconds) Connection timeout. Length of time in seconds before a slow or unresponsive connection to the system fails.
- SshKeyEnforcementMode: Enforcement mode for SSH host keys.
  - **0:** None.
  - 1: Auto. Auto accept initial key.
  - 2: Strict. Manually accept keys.
- PasswordRuleID: ID of the default password rule assigned to managed accounts created under this managed system.
- DSSKeyRuleID: ID of the default DSS key rule assigned to managed accounts created under this managed system.
- LoginAccountID: ID of the functional account used for SSH session logins.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - FunctionalAccountID: ID of the functional account used for local managed account password changes.
  - ElevationCommand: Elevation command to use (sudo, pbrun, pmrun).
  - **CheckPasswordFlag:** True to enable password testing, otherwise false.
  - · ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - ChangeFrequencyType: The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (see ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-90) When ChangeFrequencyType is xdays, password changes take place this
    configured number of days.
  - ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- RemoteClientType: The type of remote client to use.
  - o None: No remote client.
  - EPM: Endpoint Privilege Management.
- **ApplicationHostID:** Managed system ID of the target application host. Must be an ID of a managed system whose IsApplicationHost = true.
- **IsApplicationHost:** True if the managed system can be used as an application host, otherwise false. Can be set when the Platform.ApplicationHostFlag = true, and cannot be set when ApplicationHostID has a value.

• AccessURL: The URL used for cloud access (applies to cloud systems only).

## **Response Codes**

200 - Request successful. Managed System in response body.

# **GET Workgroups/{id}/ManagedSystems**

### **Purpose**

Returns a list of managed systems by Workgroup ID.

### **Required Permissions**

Password Safe System Management (Read).

#### **URL Parameters**

id: ID of the Workgroup.

### **Query Parameters (Optional)**

- limit: (default: 100000) Number of records to return.
- offset: (default: 0) Number of records to skip before returning < limit> records (can be used only in conjunction with limit).

# **Request Body**

None.

- CloudID: Cloud system ID; set if the managed system is a cloud system.
- SystemName: Name of the related entity (asset, directory, database, or cloud).
- PlatformID: ID of the managed system platform.
- **NetBiosName:** (Managed domains only) Domain NetBIOS name. Setting this value will allow Password Safe to fall back to the NetBIOS name if needed.
- Port: The port used to connect to the host. If null and the related Platform.PortFlag is true, Password Safe uses Platform.DefaultPort for communication.

- Timeout: (seconds) Connection timeout. Length of time in seconds before a slow or unresponsive connection to the system fails.
- SshKeyEnforcementMode: Enforcement mode for SSH host keys.
  - **0:** None.
  - 1: Auto. Auto accept initial key.
  - 2: Strict. Manually accept keys.
- PasswordRuleID: ID of the default password rule assigned to managed accounts created under this managed system.
- DSSKeyRuleID: ID of the default DSS key rule assigned to managed accounts created under this managed system.
- LoginAccountID: ID of the functional account used for SSH session logins.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - FunctionalAccountID: ID of the functional account used for local managed account password changes.
  - ElevationCommand: Elevation command to use (sudo, pbrun, pmrun).
  - CheckPasswordFlag: True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - ChangeFrequencyType: The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (see ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-90) When ChangeFrequencyType is xdays, password changes take place this
    configured number of days.
  - ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- RemoteClientType: The type of remote client to use.
  - o None: No remote client.
  - EPM: Endpoint Privilege Management.
- **ApplicationHostID:** Managed system ID of the target application host. Must be an ID of a managed system whose IsApplicationHost = true.
- **IsApplicationHost:** True if the managed system can be used as an application host, otherwise false. Can be set when the Platform.ApplicationHostFlag = true, and cannot be set when ApplicationHostID has a value.
- AccessURL: The URL used for cloud access (applies to cloud systems only).

# **Response Codes**

200 - Request successful. Managed System in response body.

# PUT ManagedSystems/{id}

#### **Purpose**

Updates an existing managed system by ID.

**Note: PUT ManagedSystems/{id}** supports all managed system types: dynamic asset, static asset, dynamic database, static database, directory, and cloud.

## **Required Permissions**

Password Safe System Management (Read/Write).

#### **URL Parameters**

id: ID of the managed system.

#### **Query Parameters**

Version: (optional, default: 3.0) Request body model version (3.0, 3.1, 3.2, 3.3)

# **Request Body Details**

- WorkgroupID: ID of the Workgroup.
- HostName: (required) Name of the host (applies to Static Asset, Static Database, Directory, Cloud). Max string length is 128 characters.
  - Static Asset: Asset Name.
  - Static Database: Database Host Name.
  - Directory: Directory/Domain Name.
  - Cloud: Cloud System Name.
- IPAddress: IPv4 address of the host (applies to Static Asset, Static Database).
- DnsName: DNS name of the host (applies to Static Asset, Static Database).
- InstanceName: Name of the database instance. Required when IsDefaultInstance is false (applies to Static Database only).

TC: 11/7/2023

- **IsDefaultInstance:** True if the database instance is the default instance, otherwise false. Only Platforms MS SQL Server and MySQL support setting this value to true (applies to Static Database only).
- Template: The database connection template (applies to Static Database only).
- ForestName: Name of the Directory Forest (applies to Directory only).
- UseSSL (default: false) True to use an SSL connection, otherwise false (applies to Directory only).
- PlatformID: (required) ID of the Managed System Platform.
- NetBiosName: The NetBIOS name of the host. Can be set if Platform.NetBiosNameFlag is true.
- Port: (optional) The port used to connect to the host. If null and the related Platform.PortFlag is true, Password Safe uses Platform.DefaultPort for communication.
- **Timeout:** (seconds, default: 30) Connection timeout. Length of time in seconds before a slow or unresponsive connection to the system fails.
- SshKeyEnforcementMode: (default: 0/None) Enforcement mode for SSH host keys.
  - 0: None.
  - 1: Auto Auto Accept Initial Key.
  - 2: Strict Manually Accept Keys.
- PasswordRuleID: (default: 0) ID of the default Password Rule assigned to Managed Accounts created under this Managed System.
- DSSKeyRuleID: (default: 0) ID of the default DSS Key Rule assigned to Managed Accounts created under this Managed System.
   Can be set when Platform.DSSFlag is true.
- LoginAccountID: (optional) ID of the Functional Account used for SSH Session logins. Can be set if the Platform.LoginAccountFlag is true.
- ReleaseDuration: (minutes: 1-525600, default: 120) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600, default: 525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600, default: 120) Default Information Systems Administrator (ISA) release duration.
- AutoManagementFlag: (default: false) True if password auto-management is enabled, otherwise false. Can be set if Platform.AutoManagementFlag is true.
  - FunctionalAccountID: (required if AutoManagementFlag is true) ID of the Functional Account used for local Managed
    Account password changes. FunctionalAccount.PlatformID must either match the ManagedSystem.PlatformID or be a
    Directory Platform (AD, LDAP).
  - ElevationCommand: (optional) Elevation Command to use. Can be set if Platform.SupportsElevationFlag is true.
    - sudo
      - pbrun
      - pmrun
- CheckPasswordFlag: True to enable password testing, otherwise false.
- ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
- ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
- RemoteClientType: (default: none) The type of remote client to use.
  - o None: No remote client.
  - EPM: Endpoint Privilege Management.
- **ApplicationHostID:** (default: null, required when Platform.RequiresApplicationHost = true) Managed system ID of the target application host. Must be an ID of a managed system whose IsApplicationHost = true.

- **IsApplicationHost:** (default: false) True if the managed system can be used as an application host, otherwise false. Can be set when the Platform.ApplicationHostFlag = true, and cannot be set when ApplicationHostID has a value.
- AccessURL: (default: Default URL for the selected platform) The URL used for cloud access (applies to cloud systems only). Max string length is 2048.

  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - ChangeFrequencyType: (default: first) The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (see ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-999, required if ChangeFrequencyType is xdays) When ChangeFrequencyType is xdays, password changes take place this configured number of days.
  - ChangeTime: (24hr format: 00:00-23:59, default: 23:30) UTC time of day scheduled password changes take place.

### Response Body

```
WorkgroupID : int
HostName : string

   ApplicationHost: bool,
   AccessURL: string
},
```

- ManagedSystemID: ID of the managed system.
- AssetD: Asset ID; set if the managed system is an asset or a database.
- DatabaseID: Database ID; set if the managed system is a database.
- **DirectoryID:** Directory ID; set if the managed system is a directory.
- CloudID: Cloud system ID; set if the managed system is a cloud system.
- SystemName: Name of the related entity (asset, directory, database, or cloud).
- PlatformID: ID of the managed system platform.
- NetBiosName: (Managed domains only) Domain NetBIOS name. Setting this value will allow Password Safe to fall back to the NetBIOS name if needed.
- Port: The port used to connect to the host. If null and the related **Platform.PortFlag** is true, Password Safe uses **Platform.DefaultPort** for communication.
- Timeout: (seconds) Connection timeout. Length of time in seconds before a slow or unresponsive connection to the system fails.
- SshKeyEnforcementMode: Enforcement mode for SSH host keys.
  - **0:** None.
  - 1: Auto. Auto accept initial key.
  - o 2: Strict. Manually accept keys.

- PasswordRuleID: ID of the default password rule assigned to managed accounts created under this managed system.
- DSSKeyRuleID: ID of the default DSS key rule assigned to managed accounts created under this managed system.
- LoginAccountID: ID of the functional account used for SSH session logins.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - FunctionalAccountID: ID of the functional account used for local managed account password changes.
  - ElevationCommand: Elevation command to use (sudo, pbrun, pmrun).
  - CheckPasswordFlag: True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
  - **ChangeFrequencyType:** The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (see ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-90) When ChangeFrequencyType is xdays, password changes take place this
    configured number of days.
  - ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- RemoteClientType: The type of remote client to use.
  - o None: No remote client.
  - EPM: Endpoint Privilege Management.
- **ApplicationHostID:** Managed system ID of the target application host. Must be an ID of a managed system whose IsApplicationHost = true.
- **IsApplicationHost:** True if the managed system can be used as an application host, otherwise false. Can be set when the Platform.ApplicationHostFlag = true, and cannot be set when ApplicationHostID has a value.
- AccessURL: The URL used for cloud access (applies to cloud systems only).

# Response Codes

- 200 Request successful Asset was already managed. Managed System in response body.
- 201 Request successful Asset is now managed. Managed System in response body.

### POST Workgroups/{id}/ManagedSystems

#### **Purpose**

Creates a managed system in the Workgroup referenced by ID.

#### **Required Permissions**

Password Safe System Management (Read/Write).

#### **URL Parameters**

id: ID of the Workgroup.

version: (optional, default: 3.0) Request body model version (3.0, 3.1, 3.2, 3.3).

#### Request Body (version 3.0)

```
EntityTypeID : int,
HostName : string,
IPAddress: string,
DnsName : string,
InstanceName : string,
IsDefaultInstance : bool, // can be null
Template : string,
ForestName : string,
UseSSL : bool, // can be null
PlatformID : int,
NetBiosName : string,
ContactEmail: string,
Description : string,
Port : int, // can be null
Timeout : short,
SshKeyEnforcementMode : int, // can be null
PasswordRuleID : int,
DSSKeyRuleID : int, // can be null
LoginAccountID : int, // can be null
AccountNameFormat : int,
OracleInternetDirectoryID : guid, // can be null
OracleInternetDirectoryServiceName : string,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
AutoManagementFlag: bool,
FunctionalAccountID : int, // can be null
```

**API GUIDE** 

```
ElevationCommand : string, // can be null
CheckPasswordFlag : bool,
ChangePasswordAfterAnyReleaseFlag : bool,
ResetPasswordOnMismatchFlag : bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
AccessURL : string
}
```

#### **Request Body (version 3.1)**

```
EntityTypeID : int,
HostName : string,
IPAddress: string,
DnsName : string,
InstanceName : string,
IsDefaultInstance : bool, // can be null
Template : string,
ForestName : string,
UseSSL : bool, // can be null

# Request Body Details

- EntityTypeID: (required) Type of entity being created.
- HostName: (required) Name of the host (applies to static asset, static database, directory, cloud). Max string length is 128 characters.
  - o Static Asset: Asset name.
  - Static Database: Database host name.
  - Directory: Directory/domain name.
  - Cloud: Cloud system name.
- IPAddress: IPv4 address of the host (applies to static asset, static database). Max string length is 45.

- DnsName: DNS name of the host (applies to static asset, static database). Max string length is 255.
- InstanceName: Name of the database instance. Required when IsDefaultInstance is false (applies to static database only). Max string length is 100.
- **IsDefaultInstance:** True if the database instance is the default instance, otherwise false. Only platforms MS SQL Server and MySQL support setting this value to true (applies to static database only).
- Template: The database connection template (applies to static database only).
- ForestName: Name of the directory forest (required for Active Directory; optional for Azure Active Directory). Max string length is 64.
- UseSSL (default: false) True to use an SSL connection, otherwise false (applies to directory only).
- PlatformID: (required) ID of the managed system platform.
- NetBiosName: The NetBIOS name of the host. Can be set if Platform.NetBiosNameFlag is true. Max string length is 15.
- ContactEmail: Max string length is 1000.
- Description: Max string length is 255.
- Port: (optional) The port used to connect to the host. If null and the related Platform.PortFlag is true, Password Safe uses Platform.DefaultPort for communication.
- **Timeout:** (seconds, default: 30) Connection timeout. Length of time in seconds before a slow or unresponsive connection to the system fails.
- SshKeyEnforcementMode: (default: 0/None) Enforcement mode for SSH host keys.
  - ∘ **0:** None
  - 1: Auto. Auto accept initial key.
  - 2: Strict. Manually accept keys.
- PasswordRuleID: (default: 0) ID of the default password rule assigned to managed accounts created under this managed system.
- **DSSKeyRuleID:** (default: 0) ID of the default DSS key rule assigned to managed accounts created under this managed system. Can be set when **Platform.DSSFlag** is true.
- LoginAccountID: (optional) ID of the functional account used for SSH session logins. Can be set if the Platform.LoginAccountFlag is true.
- AccountNameFormat: (Active Directory only, default: 0) Account name format to use:
  - 0: Domain and account. Use ManagedAccount.DomainName\ManagedAccount.AccountName.
  - 1: UPN. Use the managed account UPN.
  - $\circ\quad$  2: SAM. Use the managed account SAM account name.
- OracleInternetDirectoryID: The Oracle Internet Directory ID (applies to database entity types and Oracle platform only).
- OracleInternetDirectoryServiceName: (required when OracleInternetDirectoryID is set) The database service name related to the given OracleInternetDirectoryID (applies to database entity types and Oracle platform only). Max string length is 200.
- ReleaseDuration: (minutes: 1-525600, default: 120) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600, default: 525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600, default: 120) Default Information Systems Administrator (ISA) release duration.
- AutoManagementFlag: (default: false) True if password auto-management is enabled, otherwise false. Can be set if Platform.AutoManagementFlag is true.
  - FunctionalAccountID: (required if AutoManagementFlag is true) ID of the functional account used for local managed account password changes. FunctionalAccount.PlatformID must either match the ManagedSystem.PlatformID or be a directory platform (AD, LDAP).

**API GUIDE** 

- ElevationCommand: (optional) Elevation command to use. Can be set if Platform.SupportsElevationFlag is true.
  - sudo
  - pbrun
  - pmrun
- CheckPasswordFlag: True to enable password testing, otherwise false.
- ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
- ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise false.
- ApplicationHostID: (default: null, required when Platform.RequiresApplicationHost = true) Managed system ID of the target application host. Must be an ID of a managed system where IsApplicationHost = true.
- **IsApplicationHost:** (default: false) true if the managed system can be used as an application host, otherwise false. Can be set when the **Platform.ApplicationHostFlag** = true, and cannot be set when **ApplicationHostID** has a value.
- RemoteClientType: (default: None) The type of remote client to use.
  - None: No remote client.
  - EPM: Endpoint Privilege Management.
- AccessURL: (default: default URL for the selected platform) The URL used for cloud access (applies to cloud systems only). Max string length is 2048.

#### Response Body (when limit is not given)

```
WorkgroupID : int,

- **IsApplicationHost:** True if the managed system can be used as an application host, otherwise false. Can be set when the Platform.ApplicationHostFlag = true, and cannot be set when ApplicationHostID has a value.
- AccessURL: The URL used for cloud access (applies to cloud systems only).

## **Response Codes**

200 - Request successful. Managed System in response body.

# **DELETE ManagedSystems/{id}**

#### **Purpose**

Deletes a managed system by ID.

**Note: DELETE ManagedSystems/{id}** supports all managed system types: dynamic asset, static asset, dynamic database, static database, directory, and cloud.

#### **Required Permissions**

Password Safe System Management (Read/Write).

#### **URL Parameters**

id: ID of the managed system.

#### **Request Body**

None.

### **Response Body**

None.

### **Response Codes**

200 - Request successful.

# **Quick Rule Managed Systems**

### **Quick Navigation**

- "GET QuickRules/{quickRuleID}/ManagedSystems" on page 334
- "PUT QuickRules/{quickRuleID}/ManagedSystems" on page 336
- "POST QuickRules/{quickRuleID}/ManagedSystems/{systemID}" on page 337
- "DELETE QuickRules/{quickRuleID}/ManagedSystems/{systemID}" on page 339

## GET QuickRules/{quickRuleID}/ManagedSystems

#### **Purpose**

Returns a list of managed systems by Quick Rule ID.

#### **Required Permissions**

Read access to the Quick Rule.

#### **URL Parameters**

quickRuleID: ID of the Quick Rule.

### **Request Body**

None.

### **Response Body**

```
WorkgroupID : int
HostName : string
IPAddress : string
DNSName : string
InstanceName : string
IsDefaultInstance : bool // can be null
Template : string
ForestName : string
UseSSL : bool // can be null
ManagedSystemID : int,
EntityTypeID : int,
```

**API GUIDE**

### **Response Codes**

200 - Request successful. Managed Systems in the response body.

For more information, please see "Common Response Codes" on page 16.

## PUT QuickRules/{quickRuleID}/ManagedSystems

#### **Purpose**

Updates the entire list of Managed Systems in a Quick Rule by removing all **Managed System - Quick Rule** filters and adding a new one with the Managed Systems referenced by ID.

#### **Required Permissions**

Password Safe System Management (Read).

Read/Write access to the Quick Rule.

#### **URL Parameters**

quickRuleID: ID of the Quick Rule.

#### **Request Body**

Content-Type: application/json

```
{
    IDs: [ int, ...]
}
```

### **Response Body**

```
WorkgroupID : int
HostName : string
IPAddress : string
DNSName : string
InstanceName : string
IsDefaultInstance : bool // can be null
Template : string
ForestName : string
UseSSL : bool // can be null

   AccessURL: string
},
```

### Respon seCodes

200 - Request successful. Managed Systems in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST QuickRules/{quickRuleID}/ManagedSystems/{systemID}

### **Purpose**

Adds the Managed System referenced by ID to the Quick Rule by adding it to the first Managed System - Quick Rule filter found.

# **Required Permissions**

Password Safe System Management (Read).

Read/Write access to the Quick Rule.

#### **URL Parameters**

quickRuleID: ID of the Quick Rule.
systemID: ID of the Managed System.

#### Request Body

None.

#### **Response Body**

```
WorkgroupID : int
HostName : string
IPAddress : string
DNSName : string
InstanceName : string
IsDefaultInstance : bool // can be null
Template : string
ForestName : string
UseSSL : bool // can be null
ManagedSystemID : int,
EntityTypeID : int,
AssetID : int, // can be null
DatabaseID : int, // can be null
DirectoryID : int, // can be null
CloudID : int, // can be null
SystemName : string,
Timeout : short,
PlatformID: int,
NetBiosName : string,
ContactEmail: string,
Description : string,
Port : int, // can be null
Timeout : short,
SshKeyEnforcementMode : int, // can be null
PasswordRuleID : int,
DSSKeyRuleID : int, // can be null
LoginAccountID : int, // can be null
AccountNameFormat : int,
OracleInternetDirectoryID : guid, // can be null
OracleInternetDirectoryServiceName : string,
ReleaseDuration : int,
MaxReleaseDuration : int,
ISAReleaseDuration : int,
AutoManagementFlag: bool,
FunctionalAccountID : int, // can be null
ElevationCommand : string, // can be null
```

```
CheckPasswordAfterAnyReleaseFlag : bool,
ChangePasswordOnMismatchFlag : bool,
ResetPasswordOnMismatchFlag : bool,
ChangeFrequencyType : string,
ChangeFrequencyDays : int,
ChangeTime : string,
RemoteClientType : string,
ApplicationHostID : int, // can be null
IsApplicationHost : bool,
AccessURL : string
},
...
```

#### **Response Codes**

200 - Request successful. Managed Systems in the response body.

For more information, please see "Common Response Codes" on page 16.

# DELETE QuickRules/{quickRuleID}/ManagedSystems/{systemID}

#### **Purpose**

Removes the Managed System referenced by ID from the Quick Rule by removing it from all **Managed System - Quick Rule** filters found.

#### **IMPORTANT!**

A rule cannot be left in an invalid state. If removing the system would result in an empty filter, the filter itself will be removed. If there are no filters left in the rule, a "400 Bad Request" is returned.

- If you intend to replace all systems in the rule, see "PUT QuickRules/{quickRuleID}/ManagedSystems" on page 336.
- If you intend to delete the rule, see "DELETE QuickRules/{id}" on page 368.

### Required Permissions

Read/Write access to the Quick Rule.

#### **URL Parameters**

quickRuleID: ID of the Quick Rule.
systemID: ID of the Managed System.

# **Request Body**

None.

# **Response Codes**

200 - Request successful.

# **Smart Rule Managed Systems**

#### GET SmartRules/{id}/ManagedSystems

#### **Purpose**

Returns a list of managed systems by Smart Rule ID.

#### **Required Permissions**

· Read access to the Smart Rule referenced by ID.

#### **URL Parameters**

id: ID of the Smart Rule.

### **Query Parameters (Optional)**

- limit: (default: 100000) Number of records to return.
- offset: (default: 0) Number of records to skip before returning limit> records (can be used only in conjunction with limit).

## **Request Body**

None.

### Response Body (when limit is not given)

```
ManagedSystemID : int,
AssetID : int, // can be null

```

```
CheckPasswordFlag : bool,
    ChangePasswordAfterAnyReleaseFlag : bool,
    ResetPasswordOnMismatchFlag : bool,
    ChangeFrequencyType : string,
    ChangeFrequencyDays : int,
    ChangeTime : string,
    RemoteClientType : string,
    ApplicationHostID : int, // can be null
    IsApplicationHost : bool,
    AccessURL : string
},
...]
```

### **Response Codes**

200 - Request successful. Managed Systems in response body.

### **Nodes**

Nodes represent the session monitoring agent nodes that can be used for establishing sessions.

For more information on related topics, please see "Sessions" on page 396.

#### **GET Nodes**

### **Purpose**

Returns a list of session monitoring agent nodes.

### **Query Parameters**

includeInactive: (optional, default: false) True to return all nodes including nodes that are inactive, otherwise False.

#### **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
[
    NodeID: string,
    HostName: string,
    DisplayName: string,
    LastHeartbeat: DateTime, // can be null
    IsActive: bool,
},
...
]
```

### **Response Body Details**

- NodeID: Node unique ID.
- HostName: Node host name.
- DisplayName: Node display name.
- LastHeartbeat: The date and time of the last session monitoring agent heartbeat from this node.
- IsActive: True if the session monitoring agent is considered active and running, otherwise false.

# **Response Codes**

200 - Request successful. Nodes in the response body.

#### **Password Policies**

**Note:** Password policies are formerly known as password rules but the API remains **PasswordRules** to be compatible with earlier versions.

#### **Quick Navigation**

- "GET PasswordRules" on page 346
- "GET PasswordRules?enabledproducts={productName}" on page 347
- "GET PasswordRules/{id}" on page 349

#### **GET PasswordRules**

#### **Purpose**

Returns a list of password rules.

### **Required Permissions**

Password Safe System Management (Read).

## **Request Body**

None.

### **Response Body**

```
{
    PasswordRuleID : int,
    Name : string,
    Description : string,
    MinimumLength : int,
    MaximumLength : int,
    FirstCharacterRequirement : char,
    LowercaseRequirement : char,
    UppercaseRequirement : char,
    NumericRequirement : char,
    SymbolRequirement : char,
    ValidLowercaseCharacters : char[],
    ValidSymbols : char[],
```

```
EnabledProducts : int
},
...
]
```

### **Response Body Details**

- FirstCharacterRequirement: The first character of the password must be:
  - o C: Characters (alpha) only.
  - N: Numeric permitted, in addition to alpha characters.
  - A: Any character permitted.
- LowercaseRequirement: Lowercase character requirements:
- UppercaseRequirement: Uppercase character requirements:
- NumericRequirement: Numeric requirements:
- SymbolRequirement: Symbol requirements:
  - N: Not permitted.
  - P: Permitted, not required.
  - o R: Required.
- EnabledProducts: The type of products to return:
  - 1: Password Safe.
  - o 2: Secrets Safe.

### **Response Codes**

200 - Request successful. Password Rules in the response body.

400 - Enabled product not valid.

For more information, please see "Common Response Codes" on page 16.

# **GET PasswordRules?enabledproducts={productName}**

### **Purpose**

Returns a list of password rules, with an optional parameter to return polices enabled for Password Safe or Secrets Safe.

### **Required Permissions**

Password Safe System Management (Read).

### **Query Parameters**

{string} The product name to select polices enabled for Password Safe or Secrets Safe:

- 1: PasswordSafe
- 2: SecretsSafe

### **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
{
    PasswordRuleID : int,
    Name : string,
    Description : string,
    MinimumLength : int,
    MaximumLength : int,
    FirstCharacterRequirement : char,
    LowercaseRequirement : char,
    UppercaseRequirement : char,
    NumericRequirement : char,
    SymbolRequirement : char,
    ValidLowercaseCharacters : char[],
    ValidSymbols : char[],
    EnabledProducts : int
},
...
```

## **Response Body Details**

- FirstCharacterRequirement: The first character of the password must be:
  - o C: Characters (alpha) only.
  - N: Numeric permitted, in addition to alpha characters.
  - A: Any character permitted.
- LowercaseRequirement: Lowercase character requirements:
- UppercaseRequirement: Uppercase character requirements:
- NumericRequirement: Numeric requirements:

- SymbolRequirement: Symbol requirements:
  - N: Not permitted.
  - P: Permitted, not required.
  - o R: Required.
- EnabledProducts: The type of products to return:
  - 1: Password Safe.
  - o 2: Secrets Safe.

#### **Response Codes**

200 - Request successful. Password Rules in the response body.

400 - Enabled product not valid.

For more information, please see "Common Response Codes" on page 16.

# **GET PasswordRules/{id}**

#### **Purpose**

Returns a password rule by ID.

### **Required Permissions**

Password Safe System Management (Read).

#### **URL Parameters**

id: ID of the password rule.

# **Request Body**

None.

### **Response Body**

```
{
    PasswordRuleID: int,
    Name: string,
    Description: string,
```

```
MinimumLength: int,
   MaximumLength: int,
   FirstCharacterRequirement: char,
   LowercaseRequirement: char,
   UppercaseRequirement: char,
   NumericRequirement: char,
   SymbolRequirement: char,
   ValidLowercaseCharacters: char[],
   ValidUppercaseCharacters: char[],
   ValidSymbols: char[],
   EnabledProducts: int
}
```

#### **Response Body Details**

- FirstCharacterRequirement: The first character of the password must be:
  - o C: Characters (alpha) only.
  - N: Numeric permitted, in addition to alpha characters.
  - A: Any character permitted.
- LowercaseRequirement: Lowercase character requirements:
- UppercaseRequirement: Uppercase character requirements:
- NumericRequirement: Numeric requirements:
- SymbolRequirement: Symbol requirements:
  - N: Not permitted.
  - P: Permitted, not required.
  - R: Required.
- EnabledProducts: The type of products to return:
  - 1: Password Safe.
  - o 2: Secrets Safe.

## **Response Codes**

- 200 Request successful. Password rules in the response body.
- 400 Enabled product not valid.
  - i

#### **Platforms**

#### **Quick Navigation**

- "GET Platforms" on page 351
- "GET Platforms/{id}" on page 352
- "GET EntityTypes/{id}/Platforms" on page 354

For more information on related topics, please see "Entity Types" on page 202

#### **GET Platforms**

#### **Purpose**

Returns a list of platforms for managed systems.

### **Required Permissions**

None.

## **Request Body**

None.

### **Response Body**

```
PlatformID : int,
Name : string,
ShortName : string,
PortFlag : bool,
DefaultPort : int, // can be null
SupportsElevationFlag : bool,
DomainNameFlag : bool,
AutoManagementFlag : bool,
DSSAutoManagementFlag : bool,
ManageableFlag : bool,
DSSFlag : bool,
DSSFlag : bool,
LoginAccountFlag : bool,
DefaultSessionType : string // can be null,
ApplicationHostFlag : bool,
```

```
RequiresApplicationHost : bool,
    RequiresTenantID : bool,
    RequiresObjectID : bool,
    RequiresSecret : bool
}
...
```

#### **Response Body Details**

- PlatformID: Platform ID.
- Name: Platform name.
- ShortName: Platform short name.
- PortFlag: True if the platform supports setting a port, otherwise false.
- · DefaultPort: The default port used when no port is given for managed systems of this platform.
- DomainNameFlag: True if the platform supports setting a domain name on a functional account of this platform, otherwise false.
- SupportsElevationFlag: True if the platform supports elevation, otherwise false.
- · AutoManagementFlag: True if the platform supports password auto-management, otherwise false.
- DSSAutoManagementFlag: True if the platform supports DSS key auto-management, otherwise false.
- ManageableFlag: True if functional accounts can be created for the platform, otherwise false.
- DSSFlag: True if the platform supports DSS keys, otherwise false.
- LoginAccountFlag: True if the platform supports SSH login accounts, otherwise false.
- DefaultSessionType: The default type of session for the platform (RDP, SSH, or null).
- ApplicationHostFlag: true if the platform supports being used as a managed system application host, otherwise false.
- Requires Application Host: true if the platform requires a target application host, otherwise false.
- RequiresTenantID: true if the platform requires a TenantID.
- RequiresObjectID: true if the platform requires an ObjectID.
- RequiresSecret: true if the platform requires a secret.

### **Response Codes**

200 - Request successful. Platforms in response body.

For more information, please see "Common Response Codes" on page 16.

## **GET Platforms/{id}**

### **Purpose**

Returns a platform by ID for managed systems.

#### **Required Permissions**

None.

#### **URL Parameters**

id: ID of the platform.

#### **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
PlatformID : int,
Name : string,
ShortName : string,
PortFlag : bool,
DefaultPort: int, // can be null
SupportsElevationFlag : bool,
DomainNameFlag: bool,
AutoManagementFlag: bool,
DSSAutoManagementFlag: bool,
ManageableFlag: bool,
DSSFlag: bool,
LoginAccountFlag: bool,
DefaultSessionType: string // can be null,
ApplicationHostFlag: bool,
RequiresApplicationHost: bool,
RequiresTenantID : bool,
RequiresObjectID : bool,
RequiresSecret : bool
```

### **Response Body Details**

- PlatformID: Platform ID.
- Name: Platform name.
- ShortName: Platform short name.
- PortFlag: True if the platform supports setting a port, otherwise false.
- DefaultPort: The default port used when no port is given for managed systems of this platform.
- DomainNameFlag: True if the platform supports setting a domain name on a functional account of this platform, otherwise false.
- Supports Elevation Flag: True if the platform supports elevation, otherwise false.
- AutoManagementFlag: True if the platform supports password auto-management, otherwise false.

- DSSAutoManagementFlag: True if the platform supports DSS key auto-management, otherwise false.
- ManageableFlag: True if functional accounts can be created for the platform, otherwise false.
- DSSFlag: True if the platform supports DSS keys, otherwise false.
- · LoginAccountFlag: True if the platform supports SSH login accounts, otherwise false.
- DefaultSessionType: The default type of session for the platform (RDP, SSH, or null).
- ApplicationHostFlag: true if the platform supports being used as a managed system application host, otherwise false.
- Requires Application Host: true if the platform requires a target application host, otherwise false.
- RequiresTenantID: true if the platform requires a TenantID.
- RequiresObjectID: true if the platform requires an ObjectID.
- · RequiresSecret: true if the platform requires a secret.

#### **Response Codes**

200 - Request successful. Platform in response body.

For more information, please see "Common Response Codes" on page 16.

# **GET EntityTypes/{id}/Platforms**

#### **Purpose**

Returns a list of Platforms by entity type ID.

### **Required Permissions**

None.

#### **URL Parameters**

id: ID of the entity type.

### **Request Body**

None.

### **Response Body**

```
{
    PlatformID : int,
```

```
Name : string,
ShortName : string,
PortFlag : bool,
DefaultPort: int, // can be null
SupportsElevationFlag: bool,
DomainNameFlag: bool,
AutoManagementFlag: bool,
DSSAutoManagementFlag: bool,
ManageableFlag: bool,
DSSFlag: bool,
LoginAccountFlag : bool,
DefaultSessionType: string // can be null,
ApplicationHostFlag: bool,
RequiresApplicationHost: bool
RequiresTenantID : bool,
RequiresObjectID : bool,
RequiresSecret : bool
```

#### **Response Body Details**

- PlatformID: Platform ID.
- Name: Platform name.
- ShortName: Platform short name.
- PortFlag: True if the platform supports setting a port, otherwise false.
- DefaultPort: The default port used when no port is given for managed systems of this platform.
- DomainNameFlag: True if the platform supports setting a domain name on a functional account of this platform, otherwise false.
- SupportsElevationFlag: True if the platform supports elevation, otherwise false.
- AutoManagementFlag: True if the platform supports password auto-management, otherwise false.
- DSSAutoManagementFlag: True if the platform supports DSS key auto-management, otherwise false.
- ManageableFlag: True if functional accounts can be created for the platform, otherwise false.
- DSSFlag: True if the platform supports DSS keys, otherwise false.
- LoginAccountFlag: True if the platform supports SSH login accounts, otherwise false.
- DefaultSessionType: The default type of session for the platform (RDP, SSH, or null).
- ApplicationHostFlag: true if the platform supports being used as a managed system application host, otherwise false.
- RequiresApplicationHost: true if the platform requires a target application host, otherwise false.
- RequiresTenantID: true if the platform requires a TenantID.
- RequiresObjectID: true if the platform requires an ObjectID.
- RequiresSecret: true if the platform requires a secret.

### **Response Codes**

200 - Request successful. Platform in response body.

# **Propagation Action Types**

# **GET PropagationActionTypes**

#### **Purpose**

Returns a list of propagation action types.

### **Required Permissions**

Password Safe Account Management (Read).

### **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
[
    {
    PropagationActionTypeID : int,
    Name : string,
    }, ...
]
```

### **Response Codes**

200 - Request successful. Propagation action types in the response body.

# **Propagation Actions**

#### **Quick Navigation**

- "GET PropagationActions" on page 357
- "GET PropagationActions/{id}" on page 358

### **GET PropagationActions**

# **Purpose**

Returns a list of propagation actions.

### **Required Permissions**

Password Safe Account Management (Read).

### **Request Body**

None.

### **Response Body**

Content-Type: application/json

## **Response Codes**

200 - Request successful. Propagation actions in the response body.

# **GET PropagationActions/{id}**

#### **Purpose**

Returns a propagation action by ID.

### **Required Permissions**

Password Safe Account Management (Read).

### **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
PropagationActionID : int,
PropagationActionTypeID : int,
Name : string,
Description : string,
}
```

# **Response Codes**

200 - Request successful. Propagation action in the response body.

# **Managed Account Propagation Actions**

### **Quick Navigation**

- "GET ManagedAccounts/{id}/PropagationActions/" on page 359
- "POST ManagedAccounts/{id}/PropagationActions/{propagationActionID}" on page 360
- "DELETE ManagedAccounts/{id}/PropagationActions/" on page 361
- "DELETE ManagedAccounts/{id}/PropagationActions/{propagationActionID}" on page 361

## GET ManagedAccounts/{id}/PropagationActions/

#### **Purpose**

Returns a list of assigned propagation actions by managed account ID.

#### **Required Permissions**

Password Safe Account Management (Read).

### **Request Body**

None.

### Response Body

Content-Type: application/json

```
[
    {
     PropagationActionID : int,
     PropagationActionTypeID : int,
     Name : string,
     Description : string,
     SmartRuleID : int? // can be null
     }, ...
]
```

### **Response Codes**

200 - Request successful. Propagation Actions in the response body.

# POST ManagedAccounts/{id}/PropagationActions/ {propagationActionID}

#### **Purpose**

Assigns a propagation action to the managed account referenced by ID.

### **Required Permissions**

Password Safe Account Management (Read/Write).

#### **Request Body (optional)**

Content-Type: application/json

```
{
    SmartRuleID : int? // can be null
}
```

#### **Request Body Details**

**SmartRuleID**: (optional) ID of the managed system-based Smart Rule to use for the propagation action assignment. If null or not given, uses scan data to determine propagation targets.

### **Response Body**

Content-Type: application/json

```
PropagationActionID : int,
PropagationActionTypeID : int,
Name : string,
Description : string,
SmartRuleID : int? // can be null
}
```

### **Response Codes**

200 - Propagation action was already assigned. Propagation action in the response body.

201 - Propagation action was assigned successfully. Propagation action in the response body.

# **DELETE ManagedAccounts/{id}/PropagationActions/**

#### **Purpose**

Unassigns all propagation actions from the managed account by ID.

#### **Required Permissions**

Password Safe Account Management (Read/Write).

### **Request Body**

None.

#### **Response Body**

None.

#### **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# DELETE ManagedAccounts/{id}/PropagationActions/ {propagationActionID}

### **Purpose**

Unassigns a propagation action from the managed account by ID.

### **Required Permissions**

Password Safe Account Management (Read/Write).

### **Request Body**

None.

# **Response Body**

None.

# **Response Codes**

200 - Request successful.

### **Quick Rules**

Quick Rules are a specialized Smart Rule for building a list of known managed accounts by ID. Smart Rules are considered Quick Rules when they contain at least one **Managed Account Fields - Quick Group ID** filter. Quick Rules can also be accessed via the SmartRules API endpoint.

#### **Quick Navigation**

- "POST QuickRules" on page 363
- "GET QuickRules" on page 365
- "GET QuickRules/{id}" on page 365
- "GET QuickRules?title={title}" on page 366
- "GET Organizations/{orgID}/QuickRules?title={title}" on page 367
- "DELETE QuickRules/{id}" on page 368
- "DELETE QuickRules?title={title}" on page 369
- "DELETE Organizations/{orgID}/QuickRules?title={title}" on page 370

For more information on related topics, please see:

- "GET QuickRules/{quickRuleID}/ManagedAccounts" on page 266
- "PUT QuickRules/{quickRuleID}/ManagedAccounts" on page 269
- "POST QuickRules/{quickRuleID}/ManagedAccounts/{accountID}" on page 272
- "DELETE QuickRules/{quickRuleID}/ManagedAccounts/{accountID}" on page 274

### **POST QuickRules**

### **Purpose**

Creates a new Quick Rule with the managed accounts or systems referenced by ID and Rule Type.

### **Required Permissions**

When RuleType=ManagedAccount:

- · Password Safe Account Management (Read).
- Smart Rule Management Managed Account (Read/Write).

When RuleType=ManagedSystem:

- Password Safe System Management (Read).
- Smart Rule Management Managed System (Read/Write).

#### **Request Body**

Content-Type: application/json

Note: AccountIDs are deprecated. Use IDs instead.

```
{
    IDs : [ int, ...],
    Title : string,
    Category : string,
    Description : string,
    RuleType : string
}
```

#### **Request Body Details**

- AccountIDs: (deprecated) A list of managed account IDs to add to the Quick Rule.
- IDs: (required) A list of IDs to add to the Quick Rule.
- Title: (required) The title/name of the new Quick Rule. Must be unique across all Quick Rules and all Smart Rules. Max string length is 75.
- Category: (optional, default: Quick Rules) The category in which to place the Quick Rule. Max string length is 50.
- Description: (optional, default: <value of Title>) The Quick Rule description.
- RuleType: (ManagedAccount, ManagedSystem, default: ManagedAccount)

### **Response Body**

Content-Type: application/json

```
SmartRuleID : int,
OrganizationID : string, // can be null
Title : string,
Description : string,
Category : string,
Status : int,
LastProcessedDate : datetime,
IsReadOnly : bool,
RuleType : string
}
```

### **Response Codes**

201 - Request successful. Quick Rule in the response body.

#### **GET QuickRules**

#### **Purpose**

Returns a list of Quick Rules to which the current user has at least Read access.

### **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
{
    SmartRuleID : int,
    OrganizationID : string, // can be null
    Title : string,
    Description : string,
    Category : string,
    Status : int,
    LastProcessedDate : datetime,
    IsReadOnly : bool,
    RuleType : string
},
...
]
```

### **Response Codes**

200 - Request successful. Quick Rules in the response body.

For more information, please see "Common Response Codes" on page 16.

## GET QuickRules/{id}

### **Purpose**

Returns a Quick Rule by ID.

### Required permissions

Read access to the Quick Rule referenced by ID.

#### **URL Parameters**

id: ID of the Quick Rule.

### **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
SmartRuleID : int,
OrganizationID : string, // can be null
Title : string,
Description : string,
Category : string,
Status : int,
LastProcessedDate : datetime,
IsReadOnly : bool,
RuleType : string
}
```

### **Response Codes**

200 - Request successful. Quick Rule in the response body.

For more information, please see "Common Response Codes" on page 16.

### **GET QuickRules?title={title}**

### **Purpose**

Returns a Quick Rule by title.

In a multi-tenant environment, assumes global organization.

### Required permissions

Read access to the Quick Rule referenced by title.

### **Query Parameters**

title: Title of the Quick Rule.

#### **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
SmartRuleID : int,
OrganizationID : string, // can be null
Title : string,
Description : string,
Category : string,
Status : int,
LastProcessedDate : datetime,
IsReadOnly : bool,
RuleType : string
}
```

#### **Response Codes**

200 - Request successful. Quick Rule in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Organizations/{orgID}/QuickRules?title={title}**

### **Purpose**

Returns a Quick Rule by organization ID and title.

Only valid in a mult-tenant environment.

### **Required permissions**

Read access to the Quick Rule referenced by organization and title.

#### **URL Parameters**

orgID: ID of the organization.

## **Query Parameters**

title: Title of the Quick Rule.

### **Request Body**

None.

#### **Response Body**

Content-Type: application/json

```
SmartRuleID : int,
OrganizationID : string, // can be null
Title : string,
Description : string,
Category : string,
Status : int,
LastProcessedDate : datetime,
IsReadOnly : bool,
RuleType : string
}
```

#### **Response Codes**

200 - Request successful. Quick Rule in the response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE QuickRules/{id}**

### **Purpose**

Deletes a Quick Rule by ID.

### **Required Permissions**

Read/Write access to the Quick Rule referenced by ID.

#### **URL Parameters**

ID: ID of the Quick Rule.

### **Request Body**

None.

### **Response Body**

None.

## **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# **DELETE QuickRules?title={title}**

#### **Purpose**

Deletes a Quick Rule by title.

In a mult-tenant environment, assumes global organization.

### **Required Permissions**

Read/Write access to the Quick Rule referenced by title.

### **Query Parameters**

title: Title of the Quick Rule.

## **Request Body**

None.

### **Response Body**

None.

## **Response Codes**

200 - Request successful.

# **DELETE Organizations/{orgID}/QuickRules?title={title}**

#### **Purpose**

Deletes a Quick Rule by organization ID and title. Only valid in a multi-tenant environment.

#### **Required permissions**

Read/Write access to the Quick Rule referenced by organization and title.

#### **URL Parameters**

orgID: ID of the organization.

#### **Query Parameters**

title: Title of the Quick Rule.

#### **Request Body**

None.

# **Response Body**

None.

## **Response Codes**

200 - Request successful.

# Replay

#### **Quick Navigation**

- "POST pbsm/replay" on page 371
- "GET pbsm/replay/{replayId}" on page 372
- "PUT pbsm/replay/{replayId}" on page 373
- "DELETE pbsm/replay/{replayId}" on page 374

## POST pbsm/replay

#### **Purpose**

Creates a new replay session for a specified session token. The session token can be discovered using the sessions endpoints.

#### **Query Parameters**

None.

### **Request Body**

Content-Type: application/json

```
id: string, // Session Token from query to <base>/Sessions endpoint
record_key: string, // RecordKey from query to <base>/Sessions endpoint
protocol: string, // When session Type is 0 this should be RDP or for type 1 SSH
headless: boolean // Must be set to true
}
```

### **Response Body**

```
id: string, // ReplayID for this replay session
token: string, // ReplayID for this replay session
ticket: string, // Ticket value used internally
}
```

- 200 Request successful.
- 403 Access forbidden. Response body contains a message or status code indicating the reason for this forbidden access:
- 404 Not found. The requested replay session was not found on the server.

For more information, please see "Common Response Codes" on page 16.

## **GET pbsm/replay/{replayId}**

#### **Purpose**

Displays the replay session details.

#### **URL Parameters**

ReplayID: ID of the replay session returned from POST pbsm/replay.

#### **Query Parameters**

- jpeg=(scale): Requests a JPEG image of the current RDP replay session scaled in size by the given scale.
- png=(scale): Requests a PNG image of the current RDP replay session scaled in size by the given scale.
- screen=1: Requests a text representation of the current SSH session.

### **Request Body**

None.

### **Response Body**

```
tstamp: int, // Start time of the session in seconds
end: int, // End time of the session in seconds
offset: int, // Current offset of replay session in ms
next: int, // Offset of next activity of replay session in ms
speed: int, // Speed of replay session as a %
eof: boolean, // Set to true when the end of the replay has been reached
duration: int // Duration in ms of the replay session
}
```

- 200 Request successful.
- 403 Access forbidden. Response body contains a message or status code indicating the reason for this forbidden access.
- 404 Not found. The requested replay session was not found on the server.

For more information, please see "Common Response Codes" on page 16.

# PUT pbsm/replay/{replayId}

#### **Purpose**

Controls the replay session status.

#### **URL Parameters**

ReplayID: ID of the replay session returned from POST pbsm/replay.

#### **Query Parameters**

None.

### **Request Body**

```
speed: int, // Sets the replay speed of this session as a %
  offset: int, // Sets the offset of the replay cursor for this session in ms
  next: int // Requests the next changed frame based on the given % change
}
```

### **Response Body**

```
tstamp: int, // Start time of the session in seconds
end: int, // End time of the session in seconds
offset: int, // Current offset of replay session in ms
next: int, // Offset of next activity of replay session in ms
speed: int, // Speed of replay session as a %
eof: boolean, // Set to true when the end of the replay has been reached
duration: int // Duration in ms of the replay session
}
```

- 200 Request successful.
- 403 Access forbidden. Response body contains a message or status code indicating the reason for this forbidden access:
- 404 Not found. The requested replay session was not found on the server.

For more information, please see "Common Response Codes" on page 16.

# **DELETE pbsm/replay/{replayId}**

#### **Purpose**

Terminates the replay session.

#### **URL Parameters**

ReplayID: ID of the replay session returned from POST pbsm/replay.

### **Query Parameters**

None.

### **Request Body**

None.

### **Response Codes**

- 200 Request successful.
- 403 Access forbidden. Response body contains a message or status code indicating the reason for this forbidden access:
- 404 Not found. The requested replay session was not found on the server.

## Requests

#### **Quick Navigation**

- "GET Requests" on page 375
- "POST Requests" on page 376
- "POST Aliases/{aliasId}/Requests" on page 378
- "PUT Requests/{id}/Checkin" on page 380
- "PUT Requests/{id}/Approve" on page 381
- "PUT Requests/{id}/Deny" on page 382
- "PUT Requests/{id}/RotateOnCheckin" on page 383

For more information on related topics, please see "Credentials" on page 178.

### **GET Requests**

#### **Purpose**

Lists requests for the current user.

### **Query Parameters**

- status: (optional, default: all) Status of requests to return.
  - o all: Both active and pending requests.
  - o active: Requests that have been approved (including auto-approved).
  - o pending: Requests that have not yet been approved.
- queue: (optional, default: req): Type of request queue to return.
  - o req: Requestor queue, returns requests available to the user as a requestor.
  - **app:** Approver queue, returns requests for an approver or requestor/approver that have either been approved by the user (active) or have not yet been approved (pending).

### **Request Body**

None.

### **Response Body**

```
{
    RequestID: int,
    SystemID: int,
    SystemName: string,
    AccountID: int,
    AccountName: string,
    DomainName: string,
    AliasID: int,
    ApplicationID: int,
    RequestReleaseDate: date-formatted string,
    ApprovedDate: date-formatted string,
    ExpiresDate: date-formatted string,
    Status: string,
    AccessType: string
},
...
]
```

- 200 Request successful. Requests in the response body.
- 403 Access forbidden. Response body contains a message or status code indicating the reason for this forbidden access:
  - 4033 Approver Only API or account. Only Approvers can access this API or account.

For more information, please see "Common Response Codes" on page 16.

## **POST Requests**

### **Purpose**

Creates a new release request.

### **Required Roles**

· Requestor or requestor/approver role to managed account referenced by ID

For information on ISA role access, please see "ISA Requests" on page 209.

### **Request Body**

```
AccessType: string,
   SystemID: int,
   AccountID: int,
   ApplicationID: int, // can be null
   DurationMinutes : int,
   Reason : string,
   AccessPolicyScheduleID : int, // can be null
   ConflictOption : string,
   TicketSystemID : int,
   TicketNumber : string,
   RotateOnCheckin: bool
}
```

- AccessType: (optional, default: View) The type of access requested (View, RDP, SSH, App).
  - View: View Password access.
  - RDP: RDP access (corresponds to POST Sessions SessionType RDP or rdpfile).
  - SSH: SSH access (corresponds to POST Sessions SessionType SSH).
  - App: Application access (corresponds to POST Sessions SessionType App or appfile).
- SystemID: (required) ID of the managed system to request.
- · AccountID: (required) ID of the managed account to request.
- ApplicationID: (required when AccessType=App): ID of the application for an application-based request.
- DurationMinutes: (required: 1-525600) The request duration (in minutes).
- · Reason: (optional) The reason for the request.
- AccessPolicyScheduleID: (optional) The schedule ID of an access policy to use for the request. If omitted, automatically selects the best schedule.
- **ConflictOption:** (optional) The conflict resolution option to use if an existing request is found for the same user, system, and account (reuse, renew). If omitted and a conflicting request is found, returns a 409 code (see below).
  - reuse: Returns an existing, approved request ID for the same user/system/account/access type (if one exists). If the
    request does not already exist, creates a new request using the request body details.
  - renew: Cancels any existing approved requests for the same user/system/account and creates a new request using the request body details.
- TicketSystemID: ID of the ticket system. If omitted, then default ticket system will be used.
- **TicketNumber:** Number of associated ticket. Can be required if ticket system is marked as required in the access policy used. Max string length is 20.
- RotateOnCheckin: (optional, default: true) True to rotate the credentials on check-in/expiry, otherwise false. This property can only be used if the access policy (either auto-selected or given in AccessPolicyScheduleID) supports it.

**Note:** In reference to **RotateOnCheckin**, If the Managed Account given in **AccountID** does not rotate the credentials after check-in/expiry, this setting is ignored.

TC: 11/7/2023

For more information, please see the Allow API Rotation Override access policy setting under View access.

#### **Response Body**

```
{
    RequestID: int
}
```

#### **Response Codes**

- 200 Existing request is being reused. Existing request ID in the response body.
- 201 Request successful. Request ID in the response body.
- 403 User does not have permissions to request the indicated account or the account does not have API access enabled.
   Response body contains a status code indicating the reason for this forbidden access:
  - 4031 User does not have permission to request the account or the account is not valid for the system.
  - 4033 Approver Only API or account. Only Approvers can access this API or account.
  - o 4035 Not enough Approvers configured to approve a request.
- 409 Conflicting request exists. This user or another user has already requested a password for the specified account within the next <durationMinutes> window.

For more information, please see "Common Response Codes" on page 16.

# POST Aliases/{aliasId}/Requests

### **Purpose**

Creates a new release request using an alias.

### **Required Roles**

Requestor or requestor/approver role to managed account referenced by the alias.

#### **URL Parameters**

aliasId: ID of the managed account alias.

## **Request Body**

```
AccessType: string,
  DurationMinutes : int,
  Reason : string,
  AccessPolicyScheduleID : int, // can be null
  ConflictOption : string,
  TicketSystemID : int,
  TicketNumber : string,
  RotateOnCheckin: bool
}
```

- AccessType: (optional, default: View) The type of access requested (View, RDP, SSH, App).
  - View: View password access.
  - RDP: RDP access (corresponds to POST Sessions SessionType RDP or rdpfile).
  - SSH: SSH access (corresponds to POST Sessions SessionType SSH).
- DurationMinutes: (required: 1-525600): The request duration (in minutes).
- Reason: (optional) The reason for the request.
- AccessPolicyScheduleID: (optional) The schedule ID of an access policy to use for the request. If omitted, automatically selects the best schedule.
- ConflictOption: (optional) The conflict resolution option to use if an existing request is found for the same user, system, and account (reuse, renew). If omitted and a conflicting request is found, returns a 409 (see below).
  - reuse: Return an existing, approved request ID for the same user/system/account/access type (if one exists). If the
    request does not already exist, creates a new request using the request body details.
  - renew: Cancel any existing approved requests for the same user/system/account and create a new request using the request body details.
- TicketSystemID: ID of the ticket system. If omitted then default ticket system is used.
- TicketNumber: Number of associated ticket. Can be required if ticket system is marked as required in the access policy used.
   Max string length is 20.
- RotateOnCheckin: (optional, default: true) True to rotate the credentials on check-in/expiry, otherwise false. This property can
  only be used if the access policy (either auto-selected or given in AccessPolicyScheduleID) supports it. If the managed account
  given in AccountID does not rotate the credentials after check-in/expiry, this setting is ignored.

For more information, please see the Allow API Rotation Override access policy setting under View access.

## Response Body

```
{
    RequestID: int
}
```

- 200 Existing request is being reused. Existing request ID in the response body.
- 201 Request successful. Request ID in the response body.
- 403 User does not have permissions to request the indicated alias or the account referenced by the alias does not have API access enabled. Response body contains a status code indicating the reason for this forbidden access:
  - 4031 User does not have permission to request the account or the account is not valid for the system.
  - o 4033 Approver Only API or account. Only Approvers can access this API or account.
  - o 4035 Not enough approvers configured to approve a request.
- 409 Conflicting request exists. This user or another user has already requested a password for the specified account within the next <durationMinutes> window.

For more information, please see "Common Response Codes" on page 16.

## PUT Requests/{id}/Checkin

#### **Alternate URI (deprecated)**

PUT Requests/Release/{id}

### **Purpose**

Checks-in/releases a request before it has expired.

### **Required Roles**

Requestor role to managed account referenced by the request.

#### **URL Parameters**

id: ID of the request to check-in/release.

### **Request Body**

```
{
    Reason : string
}
```

Reason: (optional) A reason or comment why the request is being released. Max string length is 1000.

#### **Response Body**

None.

#### **Response Codes**

- 204 Request successful. No content in body.
- 403 User does not have permissions to release the indicated request or the associated account does not have API access enabled. Message or status code in response body:
  - 4031 User does not have permission to release a password.
  - o 4034 Request is not yet approved.

For more information, please see "Common Response Codes" on page 16.

## PUT Requests/{id}/Approve

### **Purpose**

Approves a pending request.

### **Required Roles**

Approver or requestor/approver role to managed account referenced by the request.

#### **URL Parameters**

id: ID of the request to approve.

## **Request Body**

```
{
    Reason : string
}
```

Reason: (optional) A reason or comment why the request is being approved. Max string length is 1000.

#### **Response Body**

None.

#### **Response Codes**

- 204 Request successful. No content in body.
- 403 User does not have permissions to approve the indicated request or the associated account does not have API access enabled. Message or status code in response body:
  - o 4033 Approver only User cannot approve his or her own request.
  - o 4036 Request has been approved already.

For more information, please see "Common Response Codes" on page 16.

## PUT Requests/{id}/Deny

### **Purpose**

Denies/cancels an active or pending request.

### **Required Roles**

Approver or requestor/approver role to managed account referenced by the request.

#### **URL Parameters**

id: ID of the request to deny/cancel.

### **Request Body**

```
{
    Reason : string
}
```

Reason: (optional) A reason or comment why the request is being denied/cancelled. Max string length is 1000.

#### **Response Body**

None.

#### Response Codes

- 204 Request successful. No content in body.
- 403 User does not have permissions to deny the indicated request or the associated account does not have API access enabled.
   Message or status code in response body:
- 4033 Approver only User cannot deny his or her own request.

For more information, please see "Common Response Codes" on page 16.

# PUT Requests/{id}/RotateOnCheckin

#### **Purpose**

Updates a request to rotate the credentials on check-in/expiry.

Note: If POST Requests RotateOnCheckin=false, this updates the request to true. If POST Requests RotateOnCheckin=true, the request is not modified.

### Requirements

- · Current user must be the owner of the request.
- · Request must not be cancelled or expired.

#### **URL Parameters**

id: ID of the request to update.

## **Request Body**

None.

# **Response Body**

None.

### **Response Codes**

204 - Request successful. No content in body.

# **Request Termination**

#### **Quick Navigation**

- "POST ManagedAccounts/{managedAccountID}/Requests/Terminate" on page 385
- "POST ManagedSystems/{managedSystemID}/Requests/Terminate" on page 386
- "POST Users/{userID}/Requests/Terminate" on page 387

## POST ManagedAccounts/{managedAccountID}/Requests/Terminate

#### **Purpose**

Terminates all active requests by managed account ID.

### **Required Permissions**

Password Safe API Global Quarantine (Read/Write).

#### **URL Parameters**

managedAccountID: ID of the managed account.

### **Request Body**

Content-Type: application/json

```
{
   Reason : string
}
```

## **Request Body Details**

Reason: (optional) A reason or comment why the requests are being terminated. Max string length is 1000.

### Response Body

None.

### **Response Codes**

204 - Termination successful. No content in body.

For more information, please see "Common Response Codes" on page 16.

## POST ManagedSystems/{managedSystemID}/Requests/Terminate

#### **Purpose**

Terminates all active requests by managed system ID.

#### **Required Permissions**

Password Safe API Global Quarantine (Read/Write).

#### **URL Parameters**

managedSystemID: ID of the managed system.

### **Request Body**

Content-Type: application/json

```
{
   Reason : string
}
```

### **Request Body Details**

Reason: (optional) A reason or comment why the requests are being terminated. Max string length is 1000.

### **Response Body**

None.

### **Response Codes**

204 – Termination successful. No content in body.

## POST Users/{userID}/Requests/Terminate

#### **Purpose**

Terminates all active requests by requestor user ID.

#### **Required Permissions**

Password Safe API Global Quarantine (Read/Write).

#### **URL Parameters**

userID: ID of the requestor user.

#### **Request Body**

Content-Type: application/json

```
{
    Reason : string
}
```

### **Request Body Details**

Reason: (optional) A reason or comment why the requests are being terminated. Max string length is 1000.

### **Response Body**

None.

### **Response Codes**

204 - Termination successful. No content in body.

# **Request Sets**

Request sets are a grouping of requests to the same system and account with different access types (i.e. View and RDP). Requests in a request set are also accessible individually via GET requests.

#### **Quick Navigation**

- "GET RequestSets" on page 388
- "POST RequestSets" on page 389

### **GET RequestSets**

#### **Purpose**

Lists request sets for the current user.

### **Query Parameters**

status: (optional, default: all) Status of request sets to return (all, active, pending).

### **Request Body**

None.

### **Response Body**

- 200 Request successful. Requests in the response body.
- 403 Access forbidden. Response body contains a message or status code indicating the reason for this forbidden access:
  - $^{\circ}$  4033 Approver Only API or account. Only Approvers can access this API or account.

For more information, please see "Common Response Codes" on page 16.

### **POST RequestSets**

#### **Purpose**

Creates a new release request set.

### **Required Roles**

- Requestor or Requestor/Approver role to managed account referenced by ID.
- Information Systems Administrator (ISA) role access.

For more information, please see:

- "ISA Requests" on page 209
- "ISA Sessions" on page 211

## **Request Body**

```
{
   AccessTypes: [ string, ... ],
```

```
SystemID: int,
AccountID: int,
ApplicationID: int, // can be null,
DurationMinutes : int,
Reason : string,
TicketSystemID : int,
TicketNumber : string
}
```

- AccessTypes: (at least two are required) A list of the types of access requested (View, RDP, SSH, App).
- SystemID: (required) ID of the managed system to request.
- AccountID: (required) ID of the managed account to request.
- ApplicationID: (required when an AccessType is App) ID of the application to request.
- DurationMinutes: (required) The request duration (in minutes).
- · Reason: (optional) The reason for the request.
- TicketSystemID: ID of the ticket system. If omitted then default ticket system is used.
- **TicketNumber:** Number of associated ticket. Can be required if ticket system is marked as required in the access policy used. Max string length is 20.

#### **Response Body**

```
RequestSetID: string,
Requests:
        RequestID: int,
        SystemID: int,
        SystemName: string,
        AccountID: int,
        AccountName: string,
        DomainName: string,
        ApplicationID: int, // can be null
        AliasID: int,
        RequestReleaseDate: date-formatted string,
        ApprovedDate: date-formatted string,
        ExpiresDate: date-formatted string,
        Status: string,
        AccessType: string
    },
]
```

- 201 Request successful. Request set in the response body.
- 403 User does not have permissions to perform a request for the indicated account or the account does not have API access
  enabled. Response body contains a status code indicating the reason for this forbidden access:
  - 4031 User does not have permission to request the account or the account is not valid for the system.
  - o 4033 Approver Only API or account. Only Approvers can access this API or account.
  - o 4035 Not enough approvers configured to approve a request.
- 409 Conflicting request exists. Another user has already requested a password for the specified account within the next <durationMinutes> window.

### **Roles**

(i.e. requestor, approver, credentials manager, etc.)

#### **GET Roles**

### **Purpose**

Returns a list of Password Safe roles.

### **Required Permissions**

Password Safe Role Management (Read).

#### **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
[
          RoleID : int,
          Name : string
},
...
]
```

### **Response Codes**

200 – Request successful. Roles in the response body.

# **User Group Roles**

#### **Quick Navigation**

- "GET UserGroups/{userGroupId}/SmartRules/{smartRuleId}/Roles" on page 393
- "POST UserGroups/{userGroupId}/SmartRules/{smartRuleId}/Roles" on page 394
- "DELETE UserGroups/{userGroupId}/SmartRules/{smartRuleId}/Roles" on page 395

## GET UserGroups/{userGroupId}/SmartRules/{smartRuleId}/Roles

#### **Purpose**

Returns a list of roles for the user group and Smart Rule referenced by ID.

#### **Required Permissions**

- User Accounts Management (Read)
- · Password Safe Role Management (Read).

#### **URL Parameters**

- · userGroupId: ID of the user group.
- smartRuleId: ID of the Smart Rule.

### **Request Body**

None.

### **Response Body**

```
[
    RoleID: int,
    Name: string
},
...
]
```

200 - Request successful. Roles in the response body.

For more information, please see "Common Response Codes" on page 16.

## POST UserGroups/{userGroupId}/SmartRules/{smartRuleId}/Roles

#### **Purpose**

Sets Password Safe roles for the user group and Smart Rule referenced by ID.

#### **Required Permissions**

- · User Accounts Management (Read/Write).
- · Password Safe Role Management (Read/Write).

#### **URL Parameters**

- · userGroupId: ID of the user group.
- · smartRuleId: ID of the Smart Rule.

### **Request Body**

Content-Type: application/json

### **Request Body Details**

- Roles: (required) Zero or more roles to set on the UserGroup-SmartRule.
- AccessPolicyID: The access policy ID to set on the UserGroup-SmartRule. Required when the Requestor or Requestor/Approver role is set.

#### **Response Body**

None.

#### **Response Codes**

204 - Request successful. No content in body.

For more information, please see "Common Response Codes" on page 16.

# DELETE UserGroups/{userGroupId}/SmartRules/{smartRuleId}/Roles

#### **Purpose**

Deletes all Password Safe roles for the user group and Smart Rule referenced by ID.

#### **Required Permissions**

- User Accounts Management (Read/Write).
- · Password SafeRole Management (Read/Write).

#### **URL Parameters**

- userGroupId: ID of the user group.
- smartRuleId: ID of the Smart Rule.

### **Request Body**

None.

### **Response Body**

None.

### **Response Codes**

200 - Request successful.

#### **Sessions**

#### **Quick Navigation**

- "GET Sessions" on page 396
- "GET Sessions/{id}" on page 397
- "POST Requests/{requestID}/Sessions" on page 398

#### **GET Sessions**

#### **Purpose**

Returns a list of sessions.

#### **Required Permissions**

A member of the Administrators group, or ISA or auditor role to at least one asset Smart Rule.

#### **Query Parameters (Optional)**

- status: Session status A single value or comma-delimited list of values:
  - o 0: Not Started
  - o 1: In Progress
  - o 2: Completed
  - o 5: Locked
  - 7: Terminated (deprecated)
  - o 8: Logged Off
  - 9: Disconnected (RDP only)
- . userID: ID of the user that requested the session

# **Request Body**

None.

### **Response Body**

```
[
```

```
SessionID : int,
   UserID : int,
   NodeID : string,
   Status : int,
   ArchiveStatus : int,
   Protocol : int,
   StartTime : date,
   EndTime : date,
   Duration : int,
   AssetName : string,
   ManagedSystemID : int, // can be null
   ManagedAccountID : int,
   ManagedAccountName : string,
   RecordKey: string,
   Token: string
},
```

## **Response Codes**

200 - Request successful. Sessions in the response body.

For more information, please see "Common Response Codes" on page 16.

# **GET Sessions/{id}**

## **Purpose**

Returns a session by ID.

## **Required Permissions**

A member of the Administrators group, or ISA or auditor role to at least one asset Smart Rule.

#### **URL Parameters**

id: ID of the session.

# **Request Body**

None.

## **Response Body**

```
{
    SessionID : int,
    UserID : int,
    NodeID : string,
    Status : int,
    ArchiveStatus : int,
    Protocol : int,
    StartTime : date,
    EndTime : date,
    Duration : int,
    AssetName : string,
    ManagedSystemID : int,
    ManagedAccountID : int,
    ManagedAccountName : string,
    RecordKey : string,
    Token : string
}
```

### **Response Codes**

200 - Request successful. Sessions in the response body.

For more information, please see "Common Response Codes" on page 16.

# POST Requests/{requestID}/Sessions

## **Purpose**

Create a new session for the given release.

## Requirements

Must be the owner of the request ID.

#### **URL Parameters**

requestID: ID of the request for which to create a session.

## **Request Body**

```
{
SessionType : string,
```

```
NodeID : string }
```

## **Request Body Details**

- SessionType: (required) The type of session to create (SSH or sshticket, RDP or rdpticket, rdpfile, app, or appfile).
- **NodeID:** (optional) ID of the node that should be used to establish the session. If **NodeID** is not given or if the Remote Session Proxy feature is disabled, uses the local node.

## Response Body (SSH or sshticket)

Content-Type: application/json

```
ID : string,
  Ticket : string,
  Host : string,
  Port : string,
  TicketAtHost : string,
  Link : string,
  Command : string,
  SessionID : int,
  NodeID : string
}
```

## Response Body (RDP or rdpticket)

Content-Type: application/json

```
ID : string,
  Ticket : string,
  Host : string,
  Port : string,
  SessionID : int,
  NodeID : string
}
```

## Response Body (rdpfile)

RDP File as an attachment.

## Response Body (app - when the target system is Unix- or ssh-based)

```
ID : string,
  Ticket : string,
  Host : string,
  Port : string,
  TicketAtHost : string,
  Link : string,
  Command : string,
  SessionID : int,
  NodeID : string
}
```

## Response Body (app – when the target system is Windows- or rdp-based)

Content-Type: application/json

```
ID : string,
  Ticket : string,
  Host : string,
  Port : string,
  SessionID : int,
  NodeID : string
}
```

## Response Body (appfile)

RDP File as an attachment.

## **Response Codes**

- 201- Request successful. Session details or RDP file in the response body.
- 403 Access forbidden. Response body contains a message or status code indicating the reason for this forbidden access:
- 4034 Request is not yet approved.

For more information, please see "Common Response Codes" on page 16.

# **POST Sessions/Admin**

## **Purpose**

Create a new admin session.

## **Required Roles**

Password Safe Admin Session (Read/Write).

### **Request Body**

Content-Type: application/json

```
SessionType : string,
HostName : string,
Port : int, // can be null
DomainName : string,
UserName : string,
Password : string,
Reason : string,
Resolution : string,
Resolution : string,
NDPAdminSwitch : bool,
SmartSizing : bool,
NodeID : string
}
```

### **Request Body Details**

- SessionType: (required) The type of session to create (SSH or sshticket, RDP or rdpticket, or rdpfile)
- HostName: (required) Name or IP of the target host. Max string length is 128.
- Port: (optional, default: <configured default port>) Port to use for the connection.
- DomainName: (optional) The domain name of the user. Max string length is 50.
- UserName: (required) The username. Max string length is 200.
- Password: (required) The password.
- Reason: (optional) The reason for the session.
- Resolution (RDP-only): (optional, default: <configured default resolution>) The default resolution (i.e 1024x768 or Maximized).
   Max string length is 50.
- RDPAdminSwitch (RDP-only): (optional, default: false) True to use the RDP /admin switch, otherwise false.
- SmartSizing (RDP-only): (optional, default: false) True to use RDP Smart Sizing, otherwise false. Applies only when SessionType=rdpfile.
- **NodeID:** (optional) ID of the node that should be used to establish the Session. If **NodeID** is not given or if the Remote Session Proxy feature is disabled, uses the local node.

## Response Body (SSH or sshticket)

```
{
ID : string,
```

```
Ticket : string,
Host : string,
Port : string,
TicketAtHost : string,
Link : string,
Command : string,
SessionID : int,
NodeID : string
}
```

## Response Body (RDP or rdpticket)

Content-Type: application/json

```
ID : string,
  Ticket : string,
  Host : string,
  Port : string,
  SessionID : int,
  NodeID : string
}
```

## Response Body (rdpfile)

RDP file as an attachment.

## **Response Codes**

201 – Request successful. Session details or RDP file in the response body.

403 - Access forbidden. Response body contains a message or status code indicating the reason for this forbidden access.

# **Session Locking**

## **Quick Navigation**

- "POST Sessions/{sessionID}/Lock" on page 403
- "POST ManagedAccounts/{managedAccountID}/Sessions/Lock" on page 404
- "POST ManagedSystems/{managedSystemID}/Sessions/Lock" on page 404

# POST Sessions/{sessionID}/Lock

## **Purpose**

Locks an active session.

## **Required Permissions**

One of:

- Password Safe API Global Quarantine (Read/Write)
- · Password Safe Active Session Reviewer Role, ISA Role, or a member of BeyondInsight Administrators group.

#### **URL Parameters**

sessionID: ID of the session.

## **Request Body**

None.

# **Response Body**

None.

# **Response Codes**

204 - Lock successful. No content in body.

## POST ManagedAccounts/{managedAccountID}/Sessions/Lock

### **Purpose**

Locks all active sessions by managed account ID.

### **Required Permissions**

Password Safe API Global Quarantine (Read/Write).

#### **URL Parameters**

managedAccountID: ID of the managed account.

### **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

204 - Lock successful. No content in body.

For more information, please see "Common Response Codes" on page 16.

# POST ManagedSystems/{managedSystemID}/Sessions/Lock

## **Purpose**

Locks all active Sessions by managed system ID.

# **Required Permissions**

Password Safe API Global Quarantine (Read/Write).

#### **URL Parameters**

managedSystemID: ID of the managed system.

# **Request Body**

None.

# **Response Body**

None.

## **Response Codes**

204 - Lock successful. No content in body.

## **Session Termination**

### **Quick Navigation**

- "POST Sessions/{sessionID}/Terminate" on page 406
- "POST ManagedAccounts/{managedAccountID}/Sessions/Terminate" on page 407
- "POST ManagedSystems/{managedSystemID}/Sessions/Terminate" on page 407

# POST Sessions/{sessionID}/Terminate

### **Purpose**

Terminates an active session.

## **Required Permissions**

One of:

- Password Safe API Global Quarantine (Read/Write)
- · Password Safe Active Session Reviewer Role, ISA Role, or a member of BeyondInsight Administrators group.

#### **URL Parameters**

sessionID: ID of the session to terminate.

## **Request Body**

None.

# **Response Body**

None.

## **Response Codes**

204 - Termination successful. No content in body.

# POST ManagedAccounts/{managedAccountID}/Sessions/Terminate

### **Purpose**

Terminates all active sessions by managed account ID.

### **Required Permissions**

Password Safe API Global Quarantine (Read/Write).

#### **URL Parameters**

managedAccountID: ID of the managed account.

### **Request Body**

None.

### **Response Body**

None.

## **Response Codes**

204 – Termination successful. No content in body.

For more information, please see "Common Response Codes" on page 16.

# POST ManagedSystems/{managedSystemID}/Sessions/Terminate

## **Purpose**

Terminates all active sessions by managed system ID.

## **Required Permissions**

Password Safe API Global Quarantine (Read/Write).

#### **URL Parameters**

managedSystemID: ID of the managed system.

# **Request Body**

None.

# **Response Body**

None.

# **Response Codes**

• 204 – Termination successful. No content in body.

# **Synced Accounts**

Synced accounts are managed accounts subscribed/synced to another managed account.

### **Quick Navigation**

- "GET ManagedAccounts/{id}/SyncedAccounts" on page 409
- "POST ManagedAccounts/{id}/SyncedAccounts/{syncedAccountID}" on page 412
- "DELETE ManagedAccounts/{id}/SyncedAccounts" on page 414
- "DELETE ManagedAccounts/{id}/SyncedAccounts/{syncedAccountID}" on page 415

# **GET ManagedAccounts/{id}/SyncedAccounts**

### **Purpose**

Returns a list of subscribed/synced managed accounts by managed account ID.

## **Required Permissions**

Password Safe Account Management (Read).

#### **URL Parameters**

id: ID of the parent managed account.

## **Request Body**

None.

## **Response Body**

**API GUIDE** 

```
ApiEnabled : bool,
   ReleaseNotificationEmail: string,
   ChangeServicesFlag: bool,
   RestartServicesFlag : bool,
   ReleaseDuration : int,
   MaxReleaseDuration : int,
   ISAReleaseDuration : int,
   MaxConcurrentRequests : int,
   AutoManagementFlag: bool,
   DSSAutoManagementFlag : bool,
   CheckPasswordFlag : bool,
   ResetPasswordOnMismatchFlag : bool,
   ChangePasswordAfterAnyReleaseFlag : bool,
   ChangeFrequencyType : string,
   ChangeFrequencyDays : int,
   ChangeTime : string,
   ParentAccountID : int, // can be null
   IsSubscribedAccount : bool,
   LastChangeDate : datetime, // can be null
   NextChangeDate : datetime, // can be null
   IsChanging : bool,
   ChangeState : int,
   UseOwnCredentials : bool,
   ChangeIISAppPoolFlag: bool,
   RestartIISAppPoolFlag : bool,
   WorkgroupID : int, // can be null
   ChangeWindowsAutoLogonFlag : bool,
   ChangeComPlusFlag : bool,
   ChangeDComFlag : bool,
   ChangeSComFlag: bool,
},
```

## **Response Body Details**

- DomainName: The domain name for a domain-type account.
- AccountName: The name of the account.
- DistinguishedName: The distinguished name of an LDAP managed account.
- PasswordFallbackFlag: True if failed DSS authentication can fall back to password authentication, otherwise false.
- · LoginAccountFlag: True if the account should use the managed system login account for SSH sessions, otherwise false.
- Description: A description of the account.
- PasswordRuleID: ID of the password rule assigned to this managed account.
- ApiEnabled: True if the account can be requested through the API, otherwise false.
- ReleaseNotificationEmail: Email address used for notification emails related to this managed account.
- ChangeServicesFlag: True if services run as this user should be updated with the new password after a password change, otherwise false.

- RestartServicesFlag: True if services should be restarted after the run as password is changed (ChangeServicesFlag), otherwise false.
- ReleaseDuration: (minutes: 1-525600) Default release duration.
- MaxReleaseDuration: (minutes: 1-525600) Default maximum release duration.
- ISAReleaseDuration: (minutes: 1-525600) Default Information Systems Administrator (ISA) release duration.
- MaxConcurrentRequests: (0-999, 0 is unlimited) Maximum number of concurrent password requests for this account.
- AutoManagementFlag: True if password auto-management is enabled, otherwise false.
  - DSSAutoManagementFlag: True if DSS key auto-management is enabled, otherwise false.
  - CheckPasswordFlag: True to enable password testing, otherwise false.
  - ChangePasswordAfterAnyReleaseFlag: True to change passwords on release of a request, otherwise false.
  - ResetPasswordOnMismatchFlag: True to queue a password change when scheduled password test fails, otherwise
    false.
  - **ChangeFrequencyType:** The change frequency for scheduled password changes:
    - first: Changes scheduled for the first day of the month.
    - last: Changes scheduled for the last day of the month.
    - xdays: Changes scheduled every x days (ChangeFrequencyDays).
  - ChangeFrequencyDays: (days: 1-999) When ChangeFrequencyType is xdays, password changes take place this
    configured number of days.
  - o ChangeTime: (24hr format: 00:00-23:59) UTC time of day scheduled password changes take place.
- ParentAccountID: If this is a subscribed account (IsSubscribedAccount), this is the ID of the parent managed account.
- IsSubscribedAccount: True if the account is a synced or subscribed account, otherwise false.
- LastChangeDate: The date and time of the last password change.
- NextChangeDate: The date and time of the next scheduled password change.
- IsChanging: True if the account credentials are in the process of changing, otherwise false.
- ChangeState: The change state of the account credentials:
  - 0: Idle / no change taking place or scheduled within 5 minutes.
  - 1: Changing / managed account credential currently changing.
  - 2: Queued / managed account credential is queued to change or scheduled to change within 5 minutes.

For more information, please see <u>Configure Subscriber Accounts</u> at <a href="https://www.beyondtrust.com/docs/beyondinsight-password-safe/ps/admin/managed-accounts.htm">https://www.beyondtrust.com/docs/beyondinsight-password-safe/ps/admin/managed-accounts.htm</a>#ConfigureAccounts.

## **Response Codes**

200 - Request successful. Linked Managed Account in the response body.

# POST ManagedAccounts/{id}/SyncedAccounts/{syncedAccountID}

### **Purpose**

Subscribes/syncs a managed account to the managed account referenced by ID.

### **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

- · id: ID of the parent managed account.
- · syncedAccountID: ID of the synced managed account.

### Request Body

None.

## **Response Body**

```

## Response Codes

- 200 Account was already synced. Managed Account in the response body.
- 201 Account was synced successfully. Managed Account in the response body.

For more information, please see "Common Response Codes" on page 16.

# DELETE ManagedAccounts/{id}/SyncedAccounts

## **Purpose**

Unsubscribes/unsyncs all managed accounts from the parent managed account by ID.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

id: ID of the parent managed account.

## **Request Body**

None.

## **Response Body**

None.

### **Response Codes**

200 - Request successful.

For more information, please see "Common Response Codes" on page 16.

# DELETE ManagedAccounts/{id}/SyncedAccounts/{syncedAccountID}

### **Purpose**

Unsubscribes/unsyncs a managed account from the managed account by ID.

## **Required Permissions**

Password Safe Account Management (Read/Write).

#### **URL Parameters**

- · id: ID of the parent managed account.
- syncedAccountID: ID of the synced managed account.

# **Request Body**

None.

## **Response Body**

None.

# **Response Codes**

200 - Request successful.

# **Deprecated**

The content in this section of the guide has been deprecated and is compatible with earlier versions only.

### **Quick Navigation**

- "[deprecated] GET Aliases/{name}" on page 417
- "[deprecated] GET Keystrokes/search/{condition}" on page 418
- "[deprecated] GET Keystrokes/search/{condition}/{type:int}" on page 419
- "PUT Workgroups/{workgroupName}/Assets/{assetName}/ManagedSystems/ManagedAccounts/{accountName}/Credentials" on page 420

### **Aliases**

## [deprecated] GET Aliases/{name}

**Note:** This API has been deprecated and is available for backwards compatibility only. Use **GET Aliases?name={name}** instead.

#### **Purpose**

Returns a requestable managed account alias by name.

#### Required Roles

Requestor or Requestor/Approver role for the preferred managed account referenced by the alias.

#### **URL Parameters**

name: Name of the managed account alias.

#### **Request Body**

None.

#### Response Body

```
{
    AliasId: int,
    AliasName: string,
```

```
SystemId: int,
SystemName: string,
AccountId: int,
AccountName: string,
DomainName: string,
InstanceName: string,
DefaultReleaseDuration: int,
MaximumReleaseDuration: int,
LastChangeDate: datetime,
NextChangeDate: datetime,
IsChanging: bool,
ChangeState: int,
MappedAccounts :
        AliasID: int,
        ManagedSystemID: int,
        ManagedAccountID: int,
        Status: string
    },
]
```

### **Response Codes**

200 - Request successful. Alias in response body.

For more information, please see "Common Response Codes" on page 16.

## **Keystrokes**

## [deprecated] GET Keystrokes/search/{condition}

**Note:** This API has been deprecated and is available for backwards compatibility only. Use **POST Keystrokes/Search** instead.

#### **Purpose**

Search for keystrokes by condition/keyword.

### **Required Roles**

Password Safe Auditor Role, ISA Role, or a member of BeyondInsight Administrators group.

#### **URL Parameters**

condition: Keyword to search for.

### **Response Body**

Content-Type: application/json

#### **Response Codes**

200 - Request successful. Keystrokes are in response body.

For more information, please see "Common Response Codes" on page 16.

## [deprecated] GET Keystrokes/search/{condition}/{type:int}

Note: This API has been deprecated and is available for backwards compatibility only. Use POST Keystrokes/Search instead.

#### **Purpose**

Search for keystrokes by condition/keyword and type.

### **Required Roles**

Password Safe Auditor Role, ISA Role, or a member of BeyondInsight Administrators group.

#### **URL Parameters**

- · condition: Keyword to search for.
- type: Type of keystrokes:
  - ∘ **0:** All
  - o 1: StdIn
  - o 2: StdOut

- 4: Window Event
- o 5: User Event

### **Response Body**

Content-Type: application/json

```
{
    KeystrokeID: long,
    SessionID: int,
    TimeMarker: long,
    Type: byte,
    Data: string
},
...
]
```

#### **Response Codes**

200 - Request successful. Keystrokes are in response body.

For more information, please see "Common Response Codes" on page 16.

## **Managed Account Credentials**

PUT Workgroups/{workgroupName}/Assets/ {assetName}/ManagedSystems/ManagedAccounts/{accountName}/Credentials

Note: This API has been deprecated and is available for backwards compatibility only. Use PUT

Credentials?workgroupName={workgroupName}&assetName={assetName}&accountName={accountName} instead.

#### **Purpose**

Updates the credentials for a managed account by Workgroup name, asset name, and managed account name, optionally applying the change to the managed system.

#### **Required Permissions**

One of the following is required:

- Password Safe Account Management (Read/Write)
- · ISA Role or Credentials Manager Role on a Smart Rule referencing the account

TC: 11/7/2023

#### **URL Parameters**

- workgroupName: Name of the Workgroup.
- · assetName: Name of the asset.
- accountName: Name of the managed account for which to set the credentials.

#### **Request Body**

Content-Type: application/json

```
Password: string,
PublicKey: string,
PrivateKey: string,
Passphrase: string,
UpdateSystem: bool
}
```

#### **Request Body Details**

- Password: (optional) The new password to set. If not given, generates a new random password.
- PublicKey: (required if PrivateKey is given and updateSystem=true) The new public key to set on the host.
- PrivateKey: The private key to set (provide passphrase if encrypted).
- Passphrase: (optional) The passphrase to use for an encrypted private key.
- UpdateSystem: (default: true) Whether to update the credentials on the referenced system.

#### **Response Body**

None.

#### **Response Codes**

204 - Request Successful. No Response Body.

# **Ticket Systems**

## **GET TicketSystems**

## **Purpose**

List registered ticket systems.

## **Required Permissions**

Ticket System (Read).

## **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
[
    TicketSystemID : int,
    IsActive : bool,
    TicketSystemName : string,
    Description : string,
    IsDefaultSystem : bool
},
...
]
```

## **Response Codes**

200 - Request successful. Ticket systems in the response body

## **Secrets Safe APIs**

**Note:** TeamPasswords API endpoints are deprecated in v22.4 of this guide, and replaced with SecretsSafe v22.4. TeamPasswords API endpoints remain usable, but will be removed in time.

## **Folders**

## **Quick Navigation**

- "POST Secrets-Safe/Folders/" on page 424
- "GET Secrets-Safe/Folders/" on page 425
- "PUT Secrets-Safe/Folders/{id}" on page 426
- "DELETE Secrets-Safe/Folders/{id}" on page 427
- "GET Secrets-Safe/Folders/{id}" on page 428

### POST Secrets-Safe/Folders/

## **Purpose**

Creates a new Secrets Safe folder for the given user group.

## **Required Permissions**

Secrets-Safe (Read/Write).

## **Request Body**

Content-Type: application/json

```
Name: string,
Description: string,
ParentId: Guid,
UserGroupId: int,
}
```

## **Request Body Details**

Max string length for description is 256.

# **Response Body**

```
{
   Id: Guid,
   Name: string,
```

```
Description: string,
  ParentId: Guid,
  UserGroupId: int,
}
```

## **Response Codes**

- · 201 Request successful. Secrets Safe Folder in the response body.
- 409 Conflict.

For more information, please see "Common Response Codes" on page 16.

### **GET Secrets-Safe/Folders/**

### **Purpose**

Returns a list of Secrets Safe folders to which the current user has access.

## **Required Permissions**

Secrets-Safe (Read).

# **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
[{
    Id: Guid,
    Name: string,
    Description: string,
    ParentId: Guid,
    UserGroupId: int,
},
...
]
```

# **Response Codes**

200 - Request successful. Secrets Safe Folders in the response body.

For more information, please see "Common Response Codes" on page 16.

# PUT Secrets-Safe/Folders/{id}

## **Purpose**

Updates a Secrets Safe folder by ID.

## **Required Permissions**

Secrets-Safe (Read/Write).

#### **Parameters**

id: the folder ID (GUID).

## **Request Body**

Content-Type: application/json

```
Name: string,
Description: string,
ParentId: Guid,
UserGroupId: int,
}
```

# **Request Body Details**

Max string length for description is 256.

# **Response Body**

```
[{
    Id: Guid,
    Name: string,
    Description: string,
    ParentId: Guid,
    UserGroupId: int,
},
...
]
```

## **Response Codes**

200 - Request successful. Secrets Safe Folders in the response body.

For more information, please see "Common Response Codes" on page 16.

# **DELETE Secrets-Safe/Folders/{id}**

### **Purpose**

Deletes a Secrets Safe folder by ID.

### **Required Permissions**

Secrets-Safe (Read/Write).

Note: Folders that contain secrets cannot be deleted.

#### **Parameters**

id: the folder ID (GUID).

## **Request Body**

None.

## **Response Body**

None.

## **Response Codes**

200 - Request successful. Secrets Safe folders in the response body.

# **GET Secrets-Safe/Folders/{id}**

### **Purpose**

Returns a Secrets Safe folder by ID.

## **Required Permissions**

Secrets-Safe (Read).

#### **Parameters**

id: the folder ID (GUID).

## **Request Body**

None.

## **Response Body**

Content-Type: application/json

```
Id: Guid,
Name: string,
Description: string,
ParentId: Guid,
UserGroupId: int,
}
```

## **Response Codes**

200 - Request successful. Secrets Safe Folder in the response body.

### **Secrets**

## **Quick Navigation**

- "POST Secrets-Safe/Folders/{folderId:guid}/secrets" on page 429
- "POST Secrets-Safe/Folders/{folderId:guid}/secrets/text" on page 431
- "POST Secrets-Safe/Folders/{folderId:guid}/secrets/file" on page 433
- "PUT Secrets-Safe/Secrets/{secretId:guid}/" on page 435
- "PUT Secrets-Safe/Secrets/{secretId:guid}/text" on page 437
- "PUT Secrets-Safe/Secrets/{secretId:guid}/file" on page 439
- "GET Secrets-Safe/Secrets" on page 441
- "GET Secrets-Safe/Secrets/{secretId:guid}" on page 443
- "GET Secrets-Safe/Folders/{folderId:guid}/secrets" on page 444
- "GET Secrets-Safe/Secrets/{secretId:guid}/text" on page 445
- <u>"GET Secrets-Safe/Secrets/{secretId:guid}/file" on page 447</u>
- "GET Secrets-Safe/Secrets/{secretId:guid}/file/download" on page 448
- "DELETE Secrets-Safe/Secrets/{secretId:guid}/" on page 449

# POST Secrets-Safe/Folders/{folderId:guid}/secrets

## **Purpose**

Creates a secret in the folder by ID.

## **Required Permissions**

Secrets-Safe (Read/Write).

#### **Parameters**

folderid: the folder ID (GUID).

## **Request Body**

```
Title : string,

Description : string,

Username : string,

Password : string,
```

```
OwnerId : int,
OwnerType : string,
Owners : [{
   OwnerId : int,
   Owner : string,
   Email : string,
}],
PasswordRuleID : int,
Notes : string,
Urls : [{
   Id : Guid,
        CredentialId : Guid,
        Url : String
}]
```

### **Request Body Details**

- · Max string length for description and password is 256.
- Max string length for notes is 4000.
- · Max string length for Url is 2048.
- · Required: Title, username, password.
- When OwnerType is set to User, then a list of Owners is required. When OwnerType is set to Group, the OwnerId is required (as the GroupId).
- · A password or a PasswordRuleID is required.
  - If a PasswordRuleID is passed in, then a password is generated (based on the Password Policy defined by the PasswordPolicyID).
  - If a password is passed in instead, the same behavior is followed (using that as the password).

## **Response Body**

```
[
    Id : Guid,
    Title : string,
    Description : string,
    Username : string,
    Password : string,
    OwnerId : int,
    FolderId : Guid,
    CreatedOn : Datetime,
    CreatedBy : string,
    ModifiedOn : Datetime,
    ModifiedBy : string,
    Owner : string,
    Folder : string,
```

```
FolderPath : string,
   Owners : [{
    OwnerId : int,
    Owner : string,
    Email : string,
    }],
   OwnerType : string,
   Notes : string,
   Urls : [{
    Id : Guid,
        CredentialId : Guid,
        Url : String
   }]
}
```

### **Response Codes**

201 - Created

400 - Bad Request

403 - Forbidden

409 - Conflict

For more information, please see "Common Response Codes" on page 16.

# POST Secrets-Safe/Folders/{folderId:guid}/secrets/text

## **Purpose**

Creates a text secret in the given folder ID.

## **Required Permissions**

Secrets-Safe (Read/Write).

#### **Parameters**

folderid: the folder ID (GUID).

## **Request Body**

```
Title : string,
   Description : string,
   Text : string,
   OwnerId : int,
   OwnerType : string,
   Owners : [{
   OwnerId : int,
   Owner : string,
   Email: string,
   }],
   Notes : string,
   FolderId : Guid,
Urls : [{
Id : Guid,
CredentialId : Guid,
Url : String
} ]
```

### **Request Body Details**

- · Max string length for Title and Description is 256.
- · Max string length for text is 4096.
- Max string length for notes is 4000.
- · Max string length for Url is 2048.
- · Required: Title, FolderId
- When OwnerType is set to User, then a list of Owners is required. When OwnerType is set to Group, the OwnerId is required (as the GroupId).

## **Response Body**

```
[
    Id : Guid,
    Title : string,
    Description : string,
    OwnerId : int,
    FolderId : Guid,
    CreatedOn : Datetime,
    CreatedBy : string,
    ModifiedOn : Datetime,
    ModifiedBy : string,
    Owner : string,
    Folder : string,
    FolderPath : string,
    Owners : [{
        OwnerId : int,
    }
}
```

```
Owner : string,
    Email : string,
}],
OwnerType : string,
Notes : string,
Urls : [{
    Id : Guid,
    CredentialId : Guid,
    Url : String
}]
```

# POST Secrets-Safe/Folders/{folderId:guid}/secrets/file

### **Purpose**

Creates a secret file in the given folder ID.

### **Required Permissions**

Secrets-Safe (Read/Write).

#### **Parameters**

folderid: the folder ID (GUID).

## **Request Body**

Content-Type: multipart/form-data

```
{
    Title : string,
    Description : string,
```

```
OwnerId : int,
OwnerType : string,
Owners : [{
   OwnerId : int,
Owner : string,
   Email : string,
}],
Notes : string,
FileName : string,
Urls : [{
   Id : Guid,
        CredentialId : Guid,
        Url : String
}]
```

- Max string length for Title, Description, and FileName is 256.
- Max string length for notes is 4000.
- · Max string length for Url is 2048.
- Max file size is 5 MB. Size must be greater than 0 MB.
- · Required: Title, Folderld, Filename
- When OwnerType is set to User, then a list of Owners is required. When OwnerType is set to Group, the OwnerId is required (as the GroupId).
- When adding the file, the form field name must be "secretmetadata". If the name of the form is anything else, the following error occurs: The multipart Request is missing poarts: key:'form-data'=True, key:'secretmetadata'=False.

## **Response Body**

Content-Type: application/octet-stream

Content Part One - name: form-data, type: binary

Content Part Two - name: secretmetadata, type: string

```
[
    Id : Guid,
    Title : string,
    Description : string,
    OwnerId : int,
    FolderId : Guid,
    CreatedOn : Datetime,
    CreatedBy : string,
    ModifiedOn : Datetime,
    ModifiedBy : string,
    Owner : string,
    Folder : string,
    FolderPath : string,
```

```
Owners : [{
   OwnerId : int,
   Owner : string,
   Email : string,
}],
   OwnerType : string,
   Notes : string,
   FileName : string,
   FileHash : string,

Urls : [{
   Id : Guid,
   CredentialId : Guid,
   Url : String
}]
}
```

# PUT Secrets-Safe/Secrets/{secretId:guid}/

### **Purpose**

Updates a secret based on the given ID.

## **Required Permissions**

Secrets-Safe (Read/Write).

#### **Parameters**

SecretId: the secret id (GUID)

### **Request Body**

```
FolderId : Guid,
   Title : string,
   Description : string,
   Username : string,
   Password : string,
   OwnerId : int,
   OwnerType : string,
   Owners : [{
   OwnerId : int,
   Owner : string,
   Email: string,
   PasswordRuleId : int,
  Notes : string,
Urls : [{
Id : Guid,
CredentialId : Guid,
Url : String
} ]
```

- · Max string length for description is 256.
- · Max string length for notes is 4000.
- · Max string length for Url is 2048.
- · Required: Title, username, password.
- When OwnerType is set to User, then a list of Owners is required. When OwnerType is set to Group, the OwnerId is required (as the GroupId).
- · A password or a PasswordRuleID is required.
  - If a PasswordRuleID is passed in, then a password is generated (based on the Password Policy defined by the PasswordPolicyID).
  - o If a password is passed in instead, the same behavior is followed (using that as the password).

### **Response Body**

```
[
    Id : Guid,
    Title : string,
    Description : string,
    OwnerId : int,
    FolderId : Guid,
    CreatedOn : Datetime,
    CreatedBy : string,
```

```
ModifiedOn : Datetime,
   ModifiedBy : string,
   Owner : string,
   Folder : string,
   FolderPath : string,
  Owners : [{
  OwnerId : int,
  Owner : string,
  Email: string,
  OwnerType : string,
  Notes : string,
Urls : [{
Id : Guid,
CredentialId : Guid,
Url : String
} ]
```

## PUT Secrets-Safe/Secrets/{secretId:guid}/text

### **Purpose**

Updates a secret text based on the given ID.

### **Required Permissions**

Secrets-Safe (Read/Write).

#### **Parameters**

SecretId: the secret ID (GUID)

## **Request Body**

```
FolderId : Guid,
   Title : string,
   Description : string,
   OwnerId : int,
   OwnerType : string,
   Owners : [{
   OwnerId : int,
   Owner : string,
   Email: string,
   }],
   Notes : string,
Urls : [{
Id : Guid,
CredentialId : Guid,
Url : String
} ]
```

- · Max string length for description and password is 256.
- · Max string length for notes is 4000.
- · Max string length for Url is 2048.
- · Required: Title.
- When OwnerType is set to User, then a list of Owners is required. When OwnerType is set to Group, the OwnerId is required (as the GroupId).

### **Response Body**

```
Id : Guid,
Title : string,
Description : string,
OwnerId : int,
FolderId : Guid,
CreatedOn : Datetime,
CreatedBy : string,
ModifiedOn : Datetime,
ModifiedBy : string,
Owner: string,
Folder : string,
FolderPath : string,
Owners : [{
OwnerId : int,
Owner : string,
Email: string,
OwnerType : string,
```

```
Notes : string,
Urls : [{
  Id : Guid,
    CredentialId : Guid,
    Url : String

#### **GET Secrets-Safe/Secrets**

### **Purpose**

Returns a list of secrets with the option to filter the list using query parameters.

### **Required Permissions**

Secrets-Safe (Read).

#### **Parameters**

All parameters are optional:

- · Path: the full path to the secret.
- Separator: the separator used in the path above. Default is /.
- Title: the full title of the secret.
- AfterDate: filter by modified or created on, after, or equal to the given date. Must be in the following UTC format: yyyy-MM-ddTHH:mm:ssZ.
- Limit: limit the results. Default is 1000.
- . Offset: skip the first (offset) number of secrets.

### **Request Body**

None.

### **Response Body**

Note: If no secrets match the specified filter parameter(s), a 200 (OK) response with an empty list is expected.

Content-Type: application/json

```
Id : Guid,
      Title : string,
       Description : string,
      Username : string,
      Password : string,
      OwnerId : int,
      FolderId : Guid,
      CreatedOn : Datetime,
      CreatedBy : string,
      ModifiedOn : Datetime,
      ModifiedBy : string,
      Owner : string,
      Folder : string,
      FolderPath : string,
      Owners : [{
      OwnerId : int,
      Owner : string,
      Email: string,
       OwnerType : string,
      Notes : string,
   Urls : [{
    Id : Guid,
   CredentialId : Guid,
   Url : String
    } ]
]
```

### **Response Codes**

## **GET Secrets-Safe/Secrets/{secretId:guid}**

#### **Purpose**

Returns a secret by ID.

#### **Required Permissions**

Secrets-Safe (Read).

#### **Parameters**

SecretId: the secret ID (GUID).

### **Request Body**

None.

### **Response Body**

```
Id : Guid,
  Title : string,
  Description : string,
  Username : string,
  Password : string,
  OwnerId : int,
  FolderId : Guid,
  CreatedOn : Datetime,
  CreatedBy : string,
  ModifiedOn : Datetime,
  ModifiedBy : string,
  Owner: string,
   Folder: string,
   FolderPath : string,
   Owners : [{
   OwnerId : int,
   Owner: string,
   Email: string,
   OwnerType : string,
   Notes : string,
Urls : [{
Id : Guid,
CredentialId : Guid,
```

```
Url : String
} 
}

# GET Secrets-Safe/Folders/{folderId:guid}/secrets

#### **Purpose**

Gets all the secrets based on the folderld.

#### **Required Permissions**

Secrets-Safe (Read).

#### **Parameters**

folderId: the given folder Id

### **Request Body**

None.

# **Response Body**

```
[
    Id : Guid,
    Title : string,
    Description : string,
    Username : string,
    OwnerId : int,
    FolderId : Guid,
```

```
CreatedOn : Datetime,
   CreatedBy : string,
   ModifiedOn : Datetime,
   ModifiedBy : string,
   Owner : string,
  Folder : string,
  FolderPath : string,
  Owners : [{
  OwnerId : int,
  Owner : string,
  Email: string,
  OwnerType : string,
  Notes : string,
  FileName : string,

# **GET Secrets-Safe/Secrets/{secretId:guid}/text**

## **Purpose**

Get a secret text based on the secretId.

## **Required Permissions**

Secrets-Safe (Read).

#### **Parameters**

SecretId: the secret id (GUID)

### **Request Body**

None.

### **Response Body**

Content-Type: application/json

```
Id : Guid,
  Title : string,
  Description : string,
  Text : string,
  OwnerId : int,
  FolderId : Guid,
  CreatedOn : Datetime,
  CreatedBy : string,
  ModifiedOn : Datetime,
  ModifiedBy : string,
  Owner : string,
  Folder : string,
  FolderPath : string,
  Owners : [{
  OwnerId : int,
  Owner : string,
  Email : string,
   }],
  OwnerType : string,
  Notes : string,
Urls : [{
Id : Guid,
CredentialId : Guid,
Url : String
}]
```

## **GET Secrets-Safe/Secrets/{secretId:guid}/file**

#### **Purpose**

Gets secret file based on the secretId as file metadata with file properties. This is returned as type application/json.

#### **Required Permissions**

Secrets-Safe (Read).

#### **Parameters**

SecretId: the secret id (GUID)

### **Request Body**

None.

### **Response Body**

```
Id : Guid,
  Title : string,
  Description : string,
  OwnerId : int,
  FolderId : Guid,
  CreatedOn : Datetime,
  CreatedBy : string,
  ModifiedOn : Datetime,
  ModifiedBy : string,
  Owner : string,
   Folder : string,
   FolderPath : string,
   Owners : [{
   OwnerId : int,
   Owner: string,
   Email: string,
   OwnerType : string,
   Notes : string,
   FileName : string,
   FileHash : string,
Urls : [{
Id : Guid,
CredentialId : Guid,
```

```
Url : String
}

}
```

200 - OK

403 - Forbidden

# GET Secrets-Safe/Secrets/{secretId:guid}/file/download

#### **Purpose**

Gets secret file as an attachment based on secretId.

#### **Required Permissions**

Secrets-Safe (Read).

#### **Parameters**

SecretId: the secret id (GUID)

### **Request Body**

None.

### **Response Body**

Content-Type: application/octet-stream

200 - OK

403 - Forbidden

404 - Not Found

For more information, please see "Common Response Codes" on page 16.

# **DELETE Secrets-Safe/Secrets/{secretId:guid}/**

### **Purpose**

Deletes a secret based on the secretId.

### **Required Permissions**

Secrets-Safe (Read/Write).

#### **Parameters**

SecretId: the given secret Id (GUID)

## **Request Body**

None.

### **Response Body**

None.

### **Response Codes**

200 - OK

403 - Forbidden

404 - Not found

For more information, please see "Common Response Codes" on page 16.

# **Appendix**

# Migration From v1 or v2

Any script or application written for v1 or v2 of the API needs some minor modifications to work with v3, namely the **Authorization** header and URL endpoints.

#### **Authorization Header**

In v1 and v2, the authorization header was used solely for the API application key. Now it is used to communicate the API application key as well as the RunAs username.

#### Example: C#

```
HttpClient client = new HttpClient();
client.DefaultRequestHeaders.Add("Authorization", "PS-Auth key=C9AB26FB-B322- ED97-A34C-
215CA4D9630C; runas=doe-main\johndoe;");
```

#### Example: Powershell

\$headers = @{ Authorization="PS-Auth key=C9AB26FB-B322-ED97-A34C-215CA4D9630C; runas=doemain\johndoe;"; };

## **Endpoint Comparison**

Note the use of https/SSL and removal of PasswordSafe segment in v3:

- v1 base endpoint: http://the-server/BeyondTrust/api/public/v1/PasswordSafe
- v2 base endpoint: http://the-server/BeyondTrust/api/public/v2/PasswordSafe
- v3 base endpoint: https://the-server/BeyondTrust/api/public/v3

# **Endpoint Mapping**

## Migration from v1

V1		V3	
Method	Endpoint	Method	Endpoint
GET	/v1/PasswordSafe/GetPublicKey	<deprecated></deprecated>	
GET	/v1/PasswordSafe/SignIn	<deprecated></deprecated>	
GET	/v1/PasswordSafe/Signout	POST	/v3/Auth/Signout
GET	/v1/PasswordSafe/SignAppIn	POST	/v3/Auth/SignAppin
GET	/v1/PasswordSafe/SecureSignAppIn	<deprecated></deprecated>	
GET	/v1/PasswordSafe/GetManagedAccountsList	GET	/v3/ManagedAccounts
POST	/v1/PasswordSafe/ImmediatePasswordRequest	POST	/v3/Requests
GET	/v1/PasswordSafe/GetPendingRequests	GET	/v3/Requests?status=pending
GET	/v1/PasswordSafe/GetActiveRequests	GET	/v3/Requests?status=active
POST	/v1/PasswordSafe/RetrievePassword	GET	/v3/Credentials/{requestId}
POST	/v1/PasswordSafe/RetrieveSecurePassword	<deprecated></deprecated>	
POST	/v1/PasswordSafe/ReleasePassword	PUT	/v3/Requests/{requestId}/Checkin

### Migration from v2

v2		v3	
Method	Endpoint	Method	Endpoint
GET	/v2/PasswordSafe/GetPublicKey	<deprecated></deprecated>	
GET	/v2/PasswordSafe/SignIn	<deprecated></deprecated>	
POST	/v2/PasswordSafe/Signout	POST	/v3/Auth/Signout
POST	/v2/PasswordSafe/SignAppIn	POST	/v3/Auth/SignAppin
POST	/v2/PasswordSafe/SecureSignAppIn	<deprecated></deprecated>	
GET	/v2/PasswordSafe/GetManagedAccountsList	GET	/v3/ManagedAccounts
POST	/v2/PasswordSafe/ImmediatePasswordRequest	POST	/v3/Requests
