

BeyondTrust Password Safe 7.2

New and Updated Features – December 2020

BeyondTrust Password Safe combines privileged password and session management to discover, manage, and audit all privileged credential activity. Scan, identify, and profile all assets for automated onboarding, ensuring no credentials are left unmanaged. Control privileged user accounts, applications, SSH keys, cloud admin accounts, RPA accounts, and more. Utilize adaptive access control for automated evaluation of just-in-time context for authorization access requests. Monitor and record live sessions in real time and pause or terminate suspicious sessions. Enable a searchable audit trail for compliance and forensics, and achieve complete control and accountability over privileged accounts.

Feature Highlights

Password Safe Now Available As-a-Service

We are pleased to announce that with Password Safe 7.2, we are expanding our Cloud deployment options to include Software as a Service (SaaS). Our fully featured Password Safe solution is now available both on-premises (physical or virtual appliance) and Cloud (SaaS or IaaS). Password Safe Cloud is not a new product; it is a new deployment model that builds on the existing Password Safe solution you are familiar with.

Deploying Password Safe Cloud reduces the burden of managing underlying infrastructure such as the appliances and the backend database, saving time and management effort. Password Safe Cloud enables you to get up and running quickly and begin to realize benefits in days, accelerating time-to-value. With a SaaS delivery of Password Safe, you can leverage enterprise-class scalability to meet the needs and budgets of organizations of all sizes.

Password Safe Cloud provides customers with an alternative deployment option that removes many obstacles in the implementation of a PAM solution:

- **Meet High Availability requirements in a cost-effective way:** With Password Safe Cloud, implementing Active-Active like functionality requires only a fraction of the investment that otherwise would be required with an on-prem or

IaaS option. For example, infrastructure such as an external database, the resources needed to manage it and maintain it and the costly SQL Server Enterprise license are no longer your responsibility, hence incur no extra costs.

- **New technology for enhanced performance:** The Resource Broker component encompasses the existing methods of authentication against an Active Directory or LDAP environment, automated password management, session proxy, and discovery of accounts to be managed. The Resource Broker is installed on a customer-provisioned Windows Server through a simple installer. Customers can deploy any number of Resource Brokers as needed; they are not separately licensed, giving you the flexibility necessary in today's world. The Resource Broker is introduced to assist in extending Active-Active like functionality in a simple, lightweight way.

Platform Support: Salesforce

Customers want the ability to secure and manage administrative credentials for Salesforce in Password Safe. Version 7.2 adds support for managing these credentials out-of-the-box. This builds on our support for cloud platforms that already include Amazon, Azure, Workday, and Office 365.

Enhanced Integration with BeyondTrust Secure Remote Access

In Password Safe 7.2, we have enhanced the API registration process to better integrate with the ECM (Endpoint Credential Manager) when multi-factor authentication is in use. Customers can now disable MFA when accessing user accounts through API. This feature enables a more seamless integration experience between Password Safe and the SRA appliances without impacting the security of the user interface for Password Safe.

Enhanced Password and Session Activity Report

Administrators and auditors want more detailed information available from out-of-the-box reports. Why a user checks out a session or password is critical information to understand. In version 7.2 we have added the status to the Password and Session Activity report to show the activity justification. This allows for a deeper understanding and scrutiny of why users need access.

About BeyondTrust

BeyondTrust is the worldwide leader in Privileged Access Management (PAM), empowering organizations to secure and manage their entire universe of privileges. Our integrated products and platform offer the industry's most advanced PAM solution, enabling organizations to quickly shrink their attack surface across traditional, cloud, and hybrid environments.

The BeyondTrust Universal Privilege Management approach secures and protects privileges across passwords, endpoints, and access, giving organizations the visibility and control they need to reduce risk, achieve compliance, and boost operational performance. Our products enable the right level of privileges for just the time needed, creating a frictionless experience for users, enhancing productivity.

With a heritage of innovation and a staunch commitment to customers, BeyondTrust solutions are easy to deploy, manage, and scale as businesses evolve. We are trusted by 20,000 customers, including 70 percent of the Fortune 500, and a global partner network. Learn more at www.beyondtrust.com.
