

# BeyondTrust U-Series 3.3 - What's New

## New and Updated Features

BeyondTrust® offers a full line of privileged access management appliances. These appliances provide multi-platform network discovery, centralized policy enforcement, least privilege enforcement, automated risk assessment, and powerful reporting, compliance, and regulatory audit capabilities.

The BeyondTrust U-Series 3.3 appliance (formerly known as UVM appliances), introduces new features and functionalities that enhance the user's workflows, save time, and drive efficiency by accelerating the configuration process and more. In this release we are including a completely redesigned configuration wizard that simplifies the configuration process and allows more flexibility in the implementation process. Customers will also benefit from our new configuration API which enables users to remotely configure multiple appliances at once, allowing them to save time and drive efficiency. Please read the release notes for more information.

## Feature Highlights

### New Feature Highlights

#### NEW! Configuration Wizard

---

The configuration wizard guides users through the basic setup and summarizes the most important configuration options from the configuration overview, allowing users to save time and accelerate the configuration process. This new feature accelerates the configuration and initial set-up and makes it easier for our users to understand the workflow and what each configuration setting is used for. This feature is available for customers who deploy a new appliance.

#### NEW! Configuration API – Configure Multiple Appliances without UI Interaction

---

As part of our efforts to meet the needs of the DevOps community and improve the configuration process, now users can remotely configure multiple appliances at once. Customers

that have more than one BeyondTrust U-Series appliance are now able to configure appliances simultaneously without individually accessing each appliance UI.

## NEW! BAM Agent Notification Bubbling

---

The BeyondTrust Anti-Malware agent can defend your PC against a wide variety of cyber threats. The 2012 U-Series Appliances are now protected with a custom antivirus/malware agent. This new addition includes a feature which pushes notifications directly to the Maintenance/Diagnostics web app to notify end users of critical events. This feature is intended to keep users up to date with instant notifications should a critical event occur and replaces the legacy EPP/Blink software.

## NEW! Retina Removal/Support for Phoenix

---

In tandem with the upcoming EOL of Retina, our appliances now scan for Phoenix availability and if available, offers the Discovery Scanner Role (Phoenix) in place of the legacy Vulnerability Management Role (Retina). This new functionality allows us to support our customers in their transition from our End Of Life (EOL) solution Retina onto Phoenix for asset discovery.

## Enhancements

### ENHANCEMENT! Service Renaming

---

In this release we have enhanced the renaming conventions to unify the way services are named. Previously some services had names that were not immediately apparent in regard to their functionality. All services have now been renamed to reflect the role they play in managing the U-Series Appliance.

### ENHANCEMENT! BIUL Connection String Update

---

We have added configuration options to BIUL Role (DB name/port), fixed specification, now self-specifiable.

### ENHANCEMENT! Support for v4 Licensing

---

Removal of licensing need for Enterprise Updater Service (EUS)/Retina. Switched BI Key from v3 to v4 (key no longer tied to specific installation -local machine. As long as key is activated it is good to go)
