PM Cloud

New Features and Enhancements:

Policy Editor

- Added drilldown links to improve accessibility between a rule and its target groups.
 - On the **Windows On-Demand Application Rules** page, the **Target Application Group** is now a linked URL.
 - On the **Content Rules** page, the **Target Content Group** is now a linked URL.
- The policy XML file size has been increased to 20MB. Customers with larger XML files can now leverage the import policy feature.
- You can now copy Windows or macOS application definitions. Select one or more definitions at a time. Copying definitions will save time when you want to reuse the same application definition between policies.
- Breadcrumbs were added to improve signposting to enhance the Policy Editor navigation experience. Adding visual cues will make it easier to see where you are in the Policy Editor. Click the breadcrumb URL to return to your starting point.

PM Cloud

- In Analytics v2, on the **Application Details** page, added two user activity cards to provide more context to the **Actions** line graph and provide insight to the users of an application.
 - **Users Affected** tile shows the users running an application.
 - **Reasons Provided** tile lists the reasons provided by the users.
- In Analytics v2, enhanced CSV export functionality to now support downloads of up to 5 million events from the **Events** grid. You can select the number of records to include in the export file and add a file name. A notification indicates when the file is ready to download.
- Increased the rate limit on requests and page sizes to improve the performance of the Computers and Policies APIs.
- Hid the **Changes** tab for audit types that have no change data to show. Displaying the **Changes** tab for activity audits when there was no data was misleading.
- Added clarity to the toast notification for unlicensed events shown in the **Events** grid to read *Details unavailable: Computer requires a licensed Policy for event details*. Previously, the toast notification did not clearly indicate that a licensed policy was required to display events.

Issues Resolved:

Policy Editor

- Resolved an issue in **Messages** that now surfaces validation errors that were hidden. Now, when clicking **Preview** or **Save**, validation errors are highlighted and you can add or fix message properties before proceeding.
- Resolved an issue where adding Local or Domain AD accounts with a backslash (\) in the account name failed and displayed an incorrect error *Account already exists*.

Privilege Management Cloud

- In Analytics v2, resolved an issue with special characters (such as a comma) causing errors in the CSV formatting. This occurred on the **Applications** tab and the **Users** tab. Data now displays correctly in the CSV output.
- Resolved an issue with the Computers CSV download. Renamed **Computer ID** to **ID**. The CSV download can now be used to assign computers to a group when using the PM Cloud Management API.

Known Issues:

None.

PM Cloud Windows Adapter

New Features and Enhancements:

- Updated the BeyondTrust PM Cloud Adapter service display name to BeyondTrust Privilege Management Cloud Adapter.

PM Cloud Mac Adapter

No updates.
