

## Remote Support 17.1.0 Release Notes

August 1, 2017

### Requirements:

- This version of Bomgar has been certified for physical Bomgar Appliances (B200, B300 & B400), virtual Bomgar Appliances (VMWare & Hyper-V), and cloud deployment models.
- This release requires Base software 5.1.0 or later.

### New Features and Enhancements:

- **Advanced Support Connection Enhancements** – When a customer initiates an advanced support session from their appliance to Bomgar Technical Support, the customer now can see how long Bomgar has been connected to the back end of their appliance and can also terminate the session.
- **Automated Text Translation** – Bomgar's integration with your GeoFluent account empowers your helpdesk with a global advantage by translating chats between reps and customers in real time.
- **Chrome OS Support** – Support Chrome OS devices, including Chromebook™ and Chromebox™. Helpdesk users can now view Chrome OS screens remotely to troubleshoot issues. This functionality requires G Suite to deploy the Bomgar extension to Chrome OS devices.
- **Custom Watermark** – Customize the in-session watermark using any image you like to personalize the support experience and to increase your customers' trust in the support you provide.
- **Enable Desktop Background** – Maintain a remote system's desktop background while screen sharing in full color or video optimized mode. Reps can leave customer desktops in place while enjoying the benefits of live system statuses.
- **High Availability ECM** – Install multiple endpoint credential managers (ECMs) on different systems to avoid downtime. The appliance routes credential requests through the ECM with the longest uptime. If that ECM cannot be reached, the appliance immediately begins routing requests through the ECM with the next longest uptime and sends an email to alert the administrator of ECM malfunction.
- **Idle Representative Timeout Notice Enhancements** – Administrators can choose for idle representatives to receive a notification before being logged out of the rep console due to inactivity.
- **Jump Client – Automatic Maintenance Options** – A new view of Jump Clients provides faster insight about Jump Clients that have not connected to the appliance for a certain period of time, providing information you need to better manage Jump Client deployment.
- **Jump Client – Automatic Refresh List** – The Jump Items list in the rep console now loads and automatically refreshes anytime Jump Items are added, deleted, or changed, making the Jump interface easier to use and manage.
- **Jump Client – Domain and Workgroup Search** – Smart host detection allows reps to quickly identify, sort, and manage the Jump Clients they work with every day. With improved Jump Client host searching, filtering Jump Clients to see which ones are connected to a domain or searching to see if a specific user is logged in is now much easier.
- **Jump Client - Low Profile Settings** – Several usability enhancements for Jump Clients give them a lower, more subtle profile by minimizing their visibility on individual desktops. Additionally, Bomgar administrators can prevent users from uninstalling Jump Clients locally on Mac and Linux systems.
- **Jump Client Silent Install Process Improvements** – Improvements to the Jump Client installer allow for a truly silent install using a --silent or /quiet flag.
- **Jump Groups and Roles** – Use Jump Groups to organize your Jump Items any way you want, not just by Bomgar teams. Jump Roles are now used to define what a user can do with Jump Clients, and are remarkably flexible. These two new features combined make it easier for administrators to assign the right access to the right users.
- **Native Multi-Factor Authentication Using Time-Based One-Time Passwords** – Gain the security of multi-factor authentication for your local and LDAP user accounts by enabling time-based one-time passwords. When logging into Bomgar, users must provide a one-time password generated by a separate device or app, such as Bomgar Verify.
- **Password Reset via Email** – Reset a forgotten password by means of a secure email link.
- **Real-time and Reporting API Enhancements** – Several changes have been made to the real-time state API and the reporting API to allow for more detailed reporting.

- **Rep Console Interface Enhancements** – The look and feel of both the rep console and the web rep console interfaces have been improved to make them even easier to use and increase your productivity.
- **Representative Profile Photos** – Profile photos help personalize the support experience for both the rep and the person receiving assistance. Profile photos can be manually uploaded to a rep's user account, or existing photos from LDAP can be synced for centralized management.
- **Smart Card Enhancements** – Pre-deploy registry settings for smart cards before an upgrade is available for the Bomgar Appliance software. Also, a visual indicator has been added to show the progress during a smart card elevation.
- **VNC Jump Shortcut** – Bomgar's VNC integration provides the security, collaboration, and audit features of Bomgar to VNC-enabled devices. Additionally, for supported operating systems, it is simple to deploy a Jump Client for future use, which makes future sessions more secure.
- **Web Console File Transfer** – The flexibility of the web-based rep console now allows files to be transferred between your local system and a remote system.

#### Other Enhancements:

- Added buttons to copy strings to the clipboard from the /login interface.
- Added a dashboard option to join an existing session, allowing team managers and leads to monitor sessions taking place in the web rep console.
- Added the option to block external resources, inline scripts, and inline styles on the public site by sending the "Content-Security-Policy" HTTP header.

#### Issues Resolved:

##### Atlas

- Resolved an issue with the customer client downloading from the wrong node.
- Resolved an issue with screen sharing sometimes not starting in Atlas environments.

##### Jumpoint

- Resolved an issue with Jumpoints not using point-to-point connections when enabled.

##### Presentation

- Resolved an issue with using multiple presentation client addresses causing slow connection times.

##### Representative Console

- Resolved an issue with logging into the web rep console while the native representative console was up with the edit window open.
- Resolved an issue with the representative console being closed while the representative exit survey warning window was displayed.

##### Web Rep Console

- Resolved an issue with representatives logged into the web rep console appearing as busy in their team leads' or team managers' dashboards.

##### Miscellaneous

- Resolved an issue with virtual smart card availability.

#### Known Issues:

- None.

#### Notes:

- Supports upgrades from 16.1.4+. If on a version prior to this, multiple upgrades will be required.
- This release is certified with the following Bomgar Mobile versions:
  - [iOS Rep Console 2.2.8](#)
  - [iOS Customer Client 2.2.4](#)
  - [iOS Presentation Client 2.2.1](#)
  - [Android Rep Console 2.2.6](#)
  - [Android](#), [Samsung Android](#), [HTC Android](#), and [Dell Android](#) Customer Clients 2.2.8

- [Android Presentation Client 2.2.1](#)
- The API version has been increased to 1.16.0.
- Requires Integration Client 1.6.3+.
- Require Endpoint Credential Manager 1.2.1+.
